Preface

In the late 1960s and early 1970s, the concepts of graph transformation and graph grammars started to become of interest in picture processing and computer science. The main idea was to generalize well-known rewriting techniques from strings and trees to graphs, leading to graph transformations and graph grammars. In particular, the concepts of algebraic graph transformation gained considerable importance in the early years and have done so even more in the last decade. Today, algebraic graph transformation techniques are playing a central role in theoretical computer science, as well as in several applied areas, such as software engineering, concurrent and distributed systems, and visual modeling techniques and model transformations.

The aim of this book is to present the fundamentals of algebraic graph transformation techniques for the purposes of teaching, research, and development, with respect to the following aspects:

- 1. Fundamentals in the sense of an introduction with a detailed motivation to algebraic graph transformation, including the main constructions and results, as well as their generalization to high-level replacement systems, with a wide range of applications in computer science and related areas.
- 2. Fundamentals in the sense of mathematical theories, which are the basis for precise definitions, constructions, and results, and for the implementation of algebraic graph transformation in a tool environment called AGG.
- 3. Fundamentals in the sense of the integration of data types and process specification techniques, where the concepts of algebraic data types are integrated with graph rewriting, leading to the concept of typed attributed graph transformation.

In accordance with these aims, the book is organized in four parts:

• Part I: Introduction to Graph Transformation Systems, where graph transformations based on classical graphs are introduced and the main constructions and results are motivated in detail.

- Part II: Adhesive High-Level Replacement Categories and Systems, where
 the theory is presented in a categorical framework with applications to a
 large variety of high-level structures, especially transformation systems for
 various kinds of graphs and Petri nets.
- Part III: Typed Attributed Graph Transformation Systems, where the concepts of typed attributed graphs are carefully introduced and the main results are obtained as instantiations of Part II.
- Part IV: Case Study on Model Transformation, and Tool Support by AGG, where the concepts of typed attributed graph transformation are applied in a separate case study to visual model transformation, and it is shown how the theory is implemented in the AGG tool.

The book is organized in such a way that the reader can switch, after the introduction in Part I, immediately to Part III; however, the concepts and results in both of these parts are instantiations of the categorical theory presented in Part II.

The material of this book is based on a theory of algebraic graph transformation developed at the Technical University of Berlin in cooperation with several international partners in the EU projects COMPUGRAPH, GETGRATS, APPLIGRAPH and SEGRAVIS. This material can also be seen as being in the tradition of algebraic specification techniques, described in the EATCS series of Monographs in Theoretical Computer Science.

We are most thankful to Hans-Jörg Kreowski, Michael Pfender, Hans-Jürgen Schneider, Barry Rosen, and Grzegorz Rozenberg for creating the algebraic approach to graph transformation in fruitful cooperation with the first author in the 1970s. For the main contributions to the algebraic approach in subsequent years, we would like to thank in addition Paolo Baldan, Roswitha Bardohl, Paolo Bottoni, Andrea Corradini, Gregor Engels, Claudia Ermel, Ingrid Fischer, Annegret Habel, Reiko Heckel, Berthold Hoffmann, Manuel Koch, Barbara König, Martin Korff, Jochen Küster, Juan de Lara, Leen Lambers, Michael Löwe, Ugo Montanari, Mark Minas, Fernando Orejas, Julia Padberg, Karl-Heinz Pennemann, Francesco Parisi-Presicce, Detlef Plump, Leila Ribeiro, Francesca Rossi, Olga Runge, Andy Schürr, Pawel Sobociński, Daniel Varró, Szilvia Varró-Gyapay, Annika Wagner, and Dietmar Wolz.

We would especially like to thank Reiko Heckel for several useful comments concerning the overall structure of the book.

A draft version of the book was carefully studied by the participants of a compact seminar on "Fundamentals of Algebraic Graph Transformation" for advanced students and young researchers in the SEGRAVIS TMR network. We are most grateful to the following members of this seminar, whose comments led to several useful improvements in the final version of this book: Paolo Baldan, Enrico Biermann, Benjamin Braatz, Esther Guerra, Stefan Hänsgen, Frank Herrmann, Markus Klein, Barbara König, Sebastian Kuhnert, Juan de Lara, Tihamer Levendovsky, Katharina Mehner, Tony Modica,

Mattia Monga, Allesandra Raffaetta, Guilherme Rangel, Giovanni Toffetti Carughi, Daniel Varró, Szilvia Varró-Gyapay, and Jessica Winkelmann.

Finally, we thank Grzegorz Rozenberg and all the other editors of the EATCS monograph series, and those at Springer-Verlag, especially Ronan Nugent, for smooth publication.

Berlin, Summer 2005
