Preface

The idea of a Virtual Design Studio (VDS) has been around for many years. In the early days, establishing a way of transferring documents by file transfer was enough to establish a virtual design studio. Our expectations are greater now. Along with document transfer, we expect to be able to work with others at a distance as if they were in the same physical room. We have seen how email, video conferences, and shared whiteboards can provide environments in which we can do many of the things we are used to doing face to face. The internet has changed the way we communicate at a personal level and now affects the way we work professionally. Along with the new technology and the initial excitement, we have also experienced frustration when our expectations are beyond the capability for the technology to deliver. This frustration is due to the relative immaturity of software solutions to collaboration, and also due to the lack of software support for designing. We cannot just take a set of tools off the shelf and create a virtual design studio. We first need to understand what is possible in a virtual design studio, and then understand what the technology can provide. At a more fundamental level, we need to understand the differences between working in the physical presence of our collaborators and using technology to allow us to communicate at a distance.

This book looks at the range of considerations when establishing a virtual design studio, including the development of shared understanding through representation and communication. Along with these considerations, the book presents alternatives for network technology to address the various needs of collaborating designers. The needs range from the use and transfer of digital media to the feasibility of an online meeting with full video and audio communication. The book addresses these issues in three parts: the basics of a virtual design studio, communication and representation in a virtual design studio, and the comprehensive design studio environment.

In Part I, the basic concepts and technology of the virtual design studio are introduced. The first chapter sets the scenario and then comments on the actual practice of collaborating and designing using network technology. The second chapter presents the basics of network technology, specifically, how the internet works from a designer's point of view. The third chapter is a broad coverage of how we can create design documents entirely as digital media. These chapters cover the fundamentals for setting up a virtual design studio.

In Part II, the focus turns to communication and shared understanding. Chapter 4 presents the technology and strategies for using electronic communication. This is presented according to the type of communication, the tools available to achieve communication, and the implications of choosing one communication medium over another. Chapter 5 complements the communication chapter, where the information being communicated is expressed directly in words among people, to the

communication of the design product through a shared computer representation. The issues in this chapter include the development of a shared organisation and a common vocabulary.

In Part III, different approaches to establishing a virtual design studio are presented. Chapter 6 gives an overview of the implications of a distributed design studio and considers in depth the loosely coupled solution. This distributed approach provides the most flexibility in the use of different technologies, but also requires a significant amount of management to ensure that communication really occurs. Chapter 7 considers the implementation of a central studio, located on a central server, where each participant “goes” in order to be in the virtual design studio. This approach facilitates communication and leaves document management to the individuals.

The book has a related Web site, which provides color versions of some of the illustrations of the book, on-line references to supporting software and other information related to virtual design studios. The URL of the Web site is http://www.arch.usyd.edu.au/kcdc/understanding_vds.

This book does not provide any answers to the problem of effective collaboration in a virtual design studio. Instead, the book tries to develop a better understanding of what is possible and how network technology can make the comprehensive virtual design studio possible.

Acknowledgements

The work on this book started in September 1996 after the completion of two virtual design studios initiated in 1995. We would like to thank all individuals and organisations that contributed in one form or another to the success of the research and establishment of the virtual design studios and the completion of this work:

- Milad Saad for his research on architectures for multi-user CAD, which plays an important role in virtual design studios.
- James Rutherford for his contribution to the establishment of the early virtual design studios and for designing the logo of the virtual design studio at the University of Sydney.
- John Mitchell for his ideas and great help as a consultant, client, assessor and designer in the virtual design studios.
- Student designers of the Australian and International Virtual Design Studios, and in Computer-Based Design classes, who bravely participated in this new form of design collaboration and who struggled with all the difficulties when traversing the pioneering path in the field.
- Doug Scoular and Andrew Winter, the system gurus, without whom the heterogeneous enabling technologies in the virtual design studio would have quickly come to a standstill.
- Mande Tatum, VP Distance Learning and Education, Activeworlds.com, Inc. for the invaluable assistance in setting up a virtual design studio in Activeworlds environment.
- Fay Sudweeks for her critical assessment of the early drafts on internet technology and studio configurations.
- Rosie Kemp from Springer, who gently pushed the authors to complete their work.
- Anne Christian, the person behind the camera-ready version of the book.

Some of the results reported in the book are based on the research in computer-mediated design, done in parallel with the virtual design studios in the Key Centre of Design Computing and Cognition, University of Sydney. We would like to thank volunteer designers (John Mitchell, David Marchant, John Flower, Bruce Hill) who participated in the series of experiments in computer-mediated design, which extended our knowledge of this phenomenon and consistently improved the studio layout and technological support.

We would like to thank the Australian Research Council for the financial support of the research in computer-mediated collaborative design and virtual design studios. We also thank the various companies that have provided discounts (sometimes 100%) on their products. Specifically we thank Silicon Graphics for the loan of their workstations and the use of Inperson, Activeworlds.com Inc. for the

use of the Activeworlds server software, TeamWave Software Ltd for TeamWave licenses, GraphiSoft for the use of ArchiCAD, University of British Columbia for the use of WebCT, and the BioGate Partners for the use of their BioGate Server installed in our Virtual Campus MOO. We thank Netscape Communications Corporation for the kind permission to use their logo and some of their icons in the illustrations of the book, QUALCOMM Incorporated for the permission to use elements of screen shots from their products in our illustrative materials, White Pine Software, Inc. for permission to use elements of their icons in our illustration.
