

Computer Communications and Networks

For other titles published in this series, go to
www.springer.com/series/4198

The **Computer Communications and Networks** series is a range of textbooks, monographs and handbooks. It sets out to provide students, researchers and non-specialists alike with a sure grounding in current knowledge, together with comprehensible access to the latest developments in computer communications and networking.

Emphasis is placed on clear and explanatory styles that support a tutorial approach, so that even the most complex of topics is presented in a lucid and intelligible manner.

To my wife Minghua, and our families

Preface

The advances in sensor design have decreased the size, weight, and cost of sensors by orders of magnitude, yet with the increase of higher spatial and temporal resolution and accuracy. With the fast progress of sensors design and communications technique, sensor networks have also been quickly evolving in both research and practical domains in the last decade. More and more sensor networks have been deployed in real-world to gather information for our daily life. Applications of sensor networks can be found in battlefield surveillance, environmental monitoring, biological detection, smart spaces, industrial diagnostics, etc. Although the technique of sensor networks has a very promising future, many challenges are still deserving lots of research efforts for its successful applications.

This book is devoted to coverage control, one of the most fundamental and important research issues in sensor networks. The aim of the book is to provide tutorial-like and up-to-date reference resources on various coverage control problems in sensor networks, a hot topic that has been intensively researched in recent years. Due to some unique characteristics of sensor networks such as energy constraint and ad-hoc topology, the coverage problems in sensor networks have many new scenarios and features that entitle them an important research issue in recent years. I have done my best to include in the book the most recent advances, techniques, protocols, results, and findings in this field. While I have tried to be as exhaustive as I could, the reader is advised to note that what is reported in this book is a picture of research approaches in this field taken at the middle of 2009.

Audience

This book is intended for graduate students, academic researchers, and industrial professionals who are interested in acquiring a big picture of various coverage control problems in sensor networks, including the problem scenarios, their assumptions and challenges, solution techniques and protocols. The book can serve as a reference book for undergraduate and graduate classes, or as a handbook for researchers, engineers, and developers working in the field of sensor networks.

Book Overview

This book is divided into four parts. The first part of this book provides general introductions, and the rest three parts are each devoted to a category of coverage control problems. In this book, we classify coverage problems into three categories, based on the coverage type, namely, *point coverage problems* (Part II), *area coverage problems* (Part III), and *barrier coverage problems* (Part IV).

Part I presents introductions on sensor networks and coverage control in sensor networks.

- Chapter 1 gives a short introduction to sensors, sensor nodes, and sensor networks, briefly describing the functions and characteristics of sensors, the architecture and components of sensor nodes, and the scenarios and applications of sensor networks. This chapter also discusses sensor network challenges and key research issues.
- Chapter 2 summarizes sensor coverage models mostly used in the literature, mainly elaborating their motivations, definitions, and applications. The sensor coverage model serves as a cornerstone of network-wide coverage control.
- Chapter 3 provides a big picture of various network coverage control problems, including the motivations, objectives, and design issues. We also discuss how the coverage control service can be integrated into the network protocol stack. At the end the chapter, we provide an informal definition and taxonomy for network-wide coverage control.

Part II is devoted to the point coverage problems. In the point coverage problem, the subject to be covered is a set of discrete points.

- Chapter 4 studies the node placement optimization problem for coverage configuration before network deployment, where the objective is to find the optimal locations to place sensor nodes to minimize network cost.
- Chapter 5 investigates the coverage lifetime maximization problem by controlling coverage characteristics in a randomly deployed network, where the objective is to optimally schedule sensors activities in order to extend network lifetime.

Part III is dedicated to the area coverage problems. In the area coverage problem, the subject to be covered is the whole sensor field.

- Chapter 6 discusses the *critical sensor density* (CSD) problem for coverage configuration before network deployment, where the objective is to find the least number of sensor nodes per unit area to provide complete coverage for the whole sensor field.
- Chapter 7 looks into the sensor activity scheduling problem of controlling network coverage characteristics in a randomly deployed network, where the objectives are to identify coverage redundant sensors and schedule sensors' activity in order to prolong the network lifetime.
- Chapter 8 introduces the node movement strategy problem for sensor networks containing mobile nodes, where the objective is to leverage mobile nodes to control network coverage. Mobile nodes change network coverage characteristics via

moving to the desired locations. The design of node movement strategy should balance between network coverage and movement cost.

Part IV discusses the barrier coverage problems. In the barrier coverage problem, the objective is to identify the desired coverage characteristics, if it exists, for a sensor network.

- Chapter 9 examines the coverage problems of building *intrusion barriers* for detecting intrusions of a mobile object when it traverses from one side to the other side of the sensor field. The trajectory of an intrusion mobile object is called its *traverse path*. The objective is to enable the covered points to form an intrusion barrier, stretching across the sensor field, and intersecting with every potential traverse path.
- Chapter 10 reviews the coverage problems of finding *penetration paths*. A penetration path is a continuous curve with arbitrary shape, spanning from one side to the other side of a sensor field. We assign a coverage measure (a real value) to represent the coverage characteristics of a single space point. The objective is to identify such a penetration path on which every single point satisfies the required coverage measure.

Acknowledgments

I would like to thank all the staff of Springer (Wayne Wheeler, Simon Rees, Catherine Brett) for their supports and assistances during the writing and production of the book. I am also grateful to my supervisors and colleagues who supported me and shared with me the exciting task of researching coverage issues in these years: Chua Kee Chaing, Vikram Srinivasan, Lim Hock Beng, Wang Wei, and Zhao Qun. Finally, I want to acknowledge my wife, Minghua, for her patience and support during the production of this book.

About the Author

Bang Wang received his Bachelor of Engineering and Master of Engineering degree from the Department of Electronics and Information Engineering in Huazhong University of Science and Technology (HUST) Wuhan, China in 1996 and 2000, respectively, and his PhD degree in Electrical and Computer Engineering (ECE) Department of National University of Singapore (NUS) Singapore in 2004. During his research career from 2004 to 2006, Dr. Bang Wang had worked as a research scientist in Nokia R&D center in Aalborg Denmark, as a research fellow in NUS Singapore, and as a research engineer in Panasonic Singapore Laboratories Singapore. Since 2007, Dr. Bang Wang has worked as a researcher in the Intelligent Systems Center (IntelliSys) in Singapore, an applied research center jointly set up by Singapore Technologies Engineering (ST Engineering) and Nanyang Technological

University (NTU). His main research interests include coverage and topology issues, distributed signal processing, resource allocation and optimization algorithms in wireless networks. Dr. Bang Wang had published more than forty technical articles in international journals, conferences, and books. He had also published one textbook and filed one patent. Dr. Bang Wang is a member of IEEE and has served as a technical program committee member for many international conferences.

Contents

Part I Introduction

1	Introduction	3
1.1	Sensors	3
1.2	Sensor Nodes	5
1.3	Sensor Networks	9
1.3.1	Sensor Network Scenarios	9
1.3.2	Sensor Network Applications	12
1.4	Challenges and Issues	14
1.4.1	Sensor Network Challenges	14
1.4.2	Key Research Issues	15
	References	17
2	Sensor Coverage Model	19
2.1	Motivations	19
2.2	Sensor Coverage Models	21
2.2.1	Boolean Sector Coverage Models	22
2.2.2	Boolean Disk Coverage Models	23
2.2.3	Attenuated Disk Coverage Models	25
2.2.4	Truncated Attenuated Disk Models	26
2.2.5	Detection Coverage Models	27
2.2.6	Estimation Coverage Models	30
	References	32
3	Network Coverage Control	35
3.1	Motivations and Objectives	35
3.1.1	Notes and Comments	37
3.2	Coverage Control in the Protocol Architecture	38
3.2.1	Notes and Comments	40
3.3	Design Issues of Network Coverage Control	41
3.4	A Taxonomy for Network Coverage Problems	44

Part II Target Coverage Problems

4 Node Placement Optimization	51
4.1 Node Placement as the Set-Covering Problem	51
4.2 Optimal Sensor Placement Problems	55
4.2.1 Modeling Node Placement	56
4.2.2 Approximation Algorithms	57
4.2.3 Other Placement Problems	59
References	62
5 Coverage Lifetime Maximization	65
5.1 Maximizing Target Coverage Lifetime	65
5.1.1 Disjoint Set Cover	69
5.1.2 Nondisjoint Set Cover	77
5.1.3 Notes and Comments	83
5.2 Maximizing Connected Target Coverage Lifetime	84
5.2.1 Notes and Comments	92
References	93

Part III Area Coverage Problems

6 Critical Sensor Density	99
6.1 Deterministic Node Placement	99
6.1.1 Node Placement in Two-Dimensional Field	99
6.1.2 Node Placement in Three-Dimensional Space	103
6.1.3 Notes and Comments	106
6.2 Random Node Deployment	106
6.2.1 Vacancy Analysis	106
6.2.2 Numerical Example	114
6.2.3 Notes and Comments	116
References	118
7 Sensor Activity Scheduling	121
7.1 Assumptions and Objectives	121
7.2 Preserving Complete Area Coverage	123
7.2.1 Redundancy Check Methods	123
7.2.2 Activity Scheduling Procedures	127
7.2.3 Example Scheduling Protocols	129
7.2.4 Notes and Comments	133
7.3 Preserving Partial Area Coverage	134
7.3.1 Random Independent Sleeping	134
7.3.2 Neighbor Based Scheduling	136
7.3.3 Example Scheduling Protocols	140
7.3.4 Notes and Comments	145

7.4	Preserving Area Coverage and Network Connectivity	147
7.4.1	Relation Between Area Coverage and Network Connectivity	147
7.4.2	Connected Coverage Scheduling	148
7.4.3	Notes and Comments	150
