

Studies in Systems, Decision and Control

Volume 286

Series Editor

Janusz Kacprzyk, Systems Research Institute, Polish Academy of Sciences,
Warsaw, Poland

The series “Studies in Systems, Decision and Control” (SSDC) covers both new developments and advances, as well as the state of the art, in the various areas of broadly perceived systems, decision making and control—quickly, up to date and with a high quality. The intent is to cover the theory, applications, and perspectives on the state of the art and future developments relevant to systems, decision making, control, complex processes and related areas, as embedded in the fields of engineering, computer science, physics, economics, social and life sciences, as well as the paradigms and methodologies behind them. The series contains monographs, textbooks, lecture notes and edited volumes in systems, decision making and control spanning the areas of Cyber-Physical Systems, Autonomous Systems, Sensor Networks, Control Systems, Energy Systems, Automotive Systems, Biological Systems, Vehicular Networking and Connected Vehicles, Aerospace Systems, Automation, Manufacturing, Smart Grids, Nonlinear Systems, Power Systems, Robotics, Social Systems, Economic Systems and other. Of particular value to both the contributors and the readership are the short publication timeframe and the world-wide distribution and exposure which enable both a wide and rapid dissemination of research output.

** Indexing: The books of this series are submitted to ISI, SCOPUS, DBLP, Ulrichs, MathSciNet, Current Mathematical Publications, Mathematical Reviews, Zentralblatt Math: MetaPress and Springerlink.

Introduction

One of the main objectives of systems engineering is to design, maintain, and analyze systems that help the users. To design an appropriate system for an application domain, we need to know:

- what are the users' desires and preferences, so that we know in what direction we should aim to change this domain, and
- what is the current state and what is the dynamics of this application domain, and
- how to use all this information to select the best alternatives for the system design and maintenance.

Designing a system includes selecting numerical values for many of the parameters describing the corresponding system and its subsystems. At present, in many cases, this selection is made by consulting experts and/or by following semi-heuristic recommendations (recommendations based partly on the past experience of system design and monitoring). Experience shows that such heuristic imprecise recommendations often lead to less-than-perfect results.

It is therefore desirable to come up with analytical techniques for system design, techniques that would be based on valid numerical analysis and on the solution of the corresponding optimization problems.

System engineering is a very broad discipline, with many different application domains. Each domain has its own specifics and requires its own analysis and, probably, its own analytical techniques.

In this dissertation, we formulate and analyze *general* problems corresponding to different stages of system design, implementation, testing, and monitoring, and show, on appropriate examples, how the corresponding analytical techniques can be applied to different application domains. Examples of our applications range from biological and biomedical systems (ranging from cows to humans) to social-related

systems (such as recommender systems) to physical systems (for which we provide a new system-based explanation for the minimum entropy principle) to engineering systems (for which we describe how to find the optimal proportion of testing on different levels of system design).

Contents

1	Formulation of the Problem	1
2	Analytical Techniques for Describing User Preferences: Justification for (and Extension Of) the Matrix Factorization Technique	5
2.1	Formulation of the Problem	5
2.2	Why Matrix Factorization: Our Explanation	6
	References	9
3	Analytical Techniques for Describing User Preferences: 80/20 Rule Partially Explains 7 Plus Minus 2 Law: General System-Based Analysis	11
3.1	Formulation of the Problem	11
3.2	Our Explanation	12
	References	13
4	Analytical Techniques for Analyzing Probability Distributions: How to Explain That Changes in Elderlies Depression Level Are Uniformly Distributed	15
4.1	Formulation of the Problem	15
4.2	Our Explanation	16
	References	18
5	Analytical Techniques for Analyzing How Systems Change with Time: A Natural Explanation for the Minimum Entropy Production Principles	19
5.1	Formulation of the Problem	19
5.2	How Complex Problems Are Solved: Reminder and Related Analysis	20

5.3	How This Analysis Helps Explain the Minimum Entropy Production Principle	23
	References	24
6	Analytical Techniques for Gauging Accuracy of Expert Knowledge: A Simple System-Based Explanation of the Dunning–Kruger Effect	27
6.1	Formulation of the Problem	27
6.2	Our Explanation	28
	References	31
7	Analytical Techniques Help Enhance the Results of Data Mining: Case Study of Cow Insemination	33
7.1	Formulation of the Problem	34
7.2	Our Explanation	34
	References	36
8	Analytical Techniques Help Enhance the Results of Data Mining: Why Pink Noise Is Best for Enhancing Sleep and Memory	37
8.1	Formulation of the Problem	37
8.2	Our Explanation	38
	References	39
9	Analytical Techniques Help Enhance the Results of Data Mining: Why Filtering Out Higher Harmonics Makes It Easier to Carry a Tune	41
9.1	Formulation of the Problem	41
9.2	Our Explanation	42
	References	45
10	Case When Analytical Techniques Invalidate the Conclusions of Data Mining: Reversed Flynn Effect of Decreasing IQ Test Scores	47
10.1	Formulation of the Problem	47
10.2	Systems-Based Analysis of the Problem and the Resulting Explanation of the Reversed Flynn Effect	49
10.3	Maybe the Same Idea Can Explain the Observed Increase In Universe’s Expansion Rate: A Speculative Observation	50
	References	51
11	Analytical Techniques in Hypothesis Testing: Why Area Under the Curve?	53
11.1	Formulation of the Problem	53
11.2	Our Explanation	55
	References	56

12	It Is Important to Revisit the Selection of the Best Model When New Data Appear: Why Confirmation Bias is a Faulty Strategy	57
12.1	Formulation of the Problem	57
12.2	Analysis of the Problem	58
	References	60
13	Need for a Careful Comparison Between Hypotheses: Case Study of Epicycles	61
13.1	Epicycles: Bad Science or Genius Idea.	61
13.2	Analysis of the Problem and the Resulting Conclusions	62
	References	64
14	Analytical Techniques Help in Emulating Biological Systems: An Explanation of Why High-Level Attention Constantly Oscillates	65
14.1	Formulation of the Problem	65
14.2	Analysis of the Problem	66
14.3	Oscillations Are Better: Proofs.	68
	References	71
15	Analytical Techniques for Taking into Account Several Aspects of a Designed Systems: Case Study of Computation-Communication Tradeoff	73
15.1	Formulation of the Problem	73
15.2	Description of a Model	74
15.3	Analysis of the Model: What Is the Optimal Tradeoff Between Computation and Communication	77
	References	79
16	Users Do Not Always Follow Expert Recommendations: Analytical Technique Explains Empirical Data	81
16.1	Formulation of the Problem	81
16.2	Our Explanation	82
	References	83
17	Analytical Techniques for Making Recommendations More Acceptable to Users: Status Quo Bias Actually Helps Decision Makers to Take Nonlinearity into Account	85
17.1	Formulation of the Problem	85
17.2	Analysis of the Problem and the Resulting Explanation.	86
	References	88

18 Analytical Techniques for Testing: Optimal Distribution of Testing Resources Between Different System Levels	89
18.1 Formulation of the Problem	89
18.2 Analysis of the Problem	90
18.3 Formulation of the Problem in Precise Terms	92
18.4 Solving the Resulting Optimization Problem	92
References	94
Bibliography	97
Index	99
