

Studies in Systems, Decision and Control

Volume 354

Series Editor

Janusz Kacprzyk, Systems Research Institute, Polish Academy of Sciences,
Warsaw, Poland

The series “Studies in Systems, Decision and Control” (SSDC) covers both new developments and advances, as well as the state of the art, in the various areas of broadly perceived systems, decision making and control—quickly, up to date and with a high quality. The intent is to cover the theory, applications, and perspectives on the state of the art and future developments relevant to systems, decision making, control, complex processes and related areas, as embedded in the fields of engineering, computer science, physics, economics, social and life sciences, as well as the paradigms and methodologies behind them. The series contains monographs, textbooks, lecture notes and edited volumes in systems, decision making and control spanning the areas of Cyber-Physical Systems, Autonomous Systems, Sensor Networks, Control Systems, Energy Systems, Automotive Systems, Biological Systems, Vehicular Networking and Connected Vehicles, Aerospace Systems, Automation, Manufacturing, Smart Grids, Nonlinear Systems, Power Systems, Robotics, Social Systems, Economic Systems and other. Of particular value to both the contributors and the readership are the short publication timeframe and the world-wide distribution and exposure which enable both a wide and rapid dissemination of research output.

Indexed by SCOPUS, DBLP, WTI Frankfurt eG, zbMATH, SCImago.

All books published in the series are submitted for consideration in Web of Science.

*To my dear family for their invaluable
encouragement and support during the book
writing and completion under the current
national and global pandemics and its
consequences*

Preface

The current book reflects a quite different vision of the surrounding world which was influenced in the past by the creation of a citywide distributed heterogeneous computer network from the end of sixties, well before the Internet, with our active participation. For it, computers with different even incompatible hardware and languages had to work together (some using compiled Fortran while others hardware-emulated ANALYTIC directly processing formulas as objects). And there were important numeric-analytic classes of problems which needed cooperative solutions on such hybrid networks. A full redesign of hardware and software and implanting a global language into each computer to work together was absolutely impossible at that time. A method was invented how to manage such hybrid system not from traditional beneath or inside but rather from above, with operational scenarios represented on a symbiotic mixture of different languages which were freely migrating between computers. The needed portion for a particular computer with its unique language was dynamically extracted from the symbiotic scenario, and the results obtained were reintegrated with the rest of the scenario to be processed on other computers, and so on.

And this symbiotic dynamic coverage of a computer network subsequently resulted in a much broader and universal ideology and concept of controlled wavelike (even virus-like) matching of heterogeneous networks by powerful recursive scenarios not only navigating different worlds in parallel but also supplying the covered systems with active command, control, and processing infrastructures which could generate further waves, and so on. And this mode of dealing with distributed worlds from above was also influenced by some activities in art like painting and modern sculptures and also obsession with gestalt psychology considering systems directly as a whole rather than by parts, with the use of spatial images and patterns rather than traditional logic. And all this resulted in the patented Spatial Grasp Technology (SGT) and five previous books, other publications too, with a new international patent being prepared.

Along with describing details of the latest SGT version, we will be showing how to provide deep integration of physical and virtual worlds, also simulation with live control up to their full symbiosis and within the same high-level Spatial Grasp Language (SGL). This may also be considered as a scientific response to the

ongoing hot discussions of what is actually real and what simulated. Some basic network operations will be exhibited in SGL suitable for solving network-related problems in different areas, also simulated examples related to the mysterious notion of consciousness which may be important for advanced intelligent systems. Will also be shown how to model the worldwide spread of viruses and influence of distribution of antivirus vaccine, as a response to the current pandemic disaster, and implementation examples in SGL for the latest decision-centric and mosaic-based concepts for effective organization of modern military and industrial systems.

The presented examples of high-level holistic solutions for these and other tasks from the previous publications are often hundreds of times simpler and shorter than under other approaches, which gives us encouragement for the further research and development in the mentioned areas. We also hope that the developed approach may be useful for the creation of international technological bodies oriented on fighting global crises and disasters, the current pandemics including.

9. Advances in Machine Learning and Artificial Intelligence <http://opastonline.com/journal/advances-in-machine-learning-artificial-intelligence>

The accepted and published abstract at this reputable world symposium: THE SCIENCE OF CONSCIOUSNESS | TSC 2020, inspired inclusion into the book of a chapter devoted to simulation of such mysterious and so far not fully understood notion and problem as consciousness. <https://consciousness.arizona.edu/>.

Also, the accepted keynote at Global Conference on Biomedical Engineering and Systems, with fighting pandemics as one of its main orientations, inspired inclusion into the book of a special chapter on simulation of the spread of malicious viruses and global world fight with them. <https://www.pagesconferences.com/biomedical-engineering/>.
