Library Support for Resource Constrained Accelerators

Laust Brock-Nannestad and Sven Karlsson Technical University of Denmark

Motivation

- Accelerators provide attractive power/performance trade offs
- Existing programming models treat them as offload devices
- ► We want accelerator cores as **first class citizens**
 - Execute your application directly from the accelerator
 - Spawn parallelism from accelerator
 - \blacktriangleright But retain convenience of a complete system: libraries, file I/O, ...

Experimental setups

- ▶ 1) Dual Socket Xeon 5570 @ 2.93 GHz, Linux 3.2, GCC 4.8.1, glibc 2.17
- ► 2) Adapteva Parallella w. 16 core Epiphany accelerator
- ► SPLASH-2 benchmarks LU, FFT, C-runtime library offloaded to host
- ► Baseline is SPLASH-2 parallelized with GNU libgomp for GCC 4.8.1

Execution time (x86-64)

Contributions

- ► A new runtime for accelerators
 - ► Accelerator drives execution main() on accelerator
 - Low overhead moving C library to host keeps runtime small
- Implementation on x86-64 and ARM + Epiphany (Parallella)
- Evaluation using SPLASH-2; comparison to libgomp
- Measure impact on object code size by minimizing runtime

Design

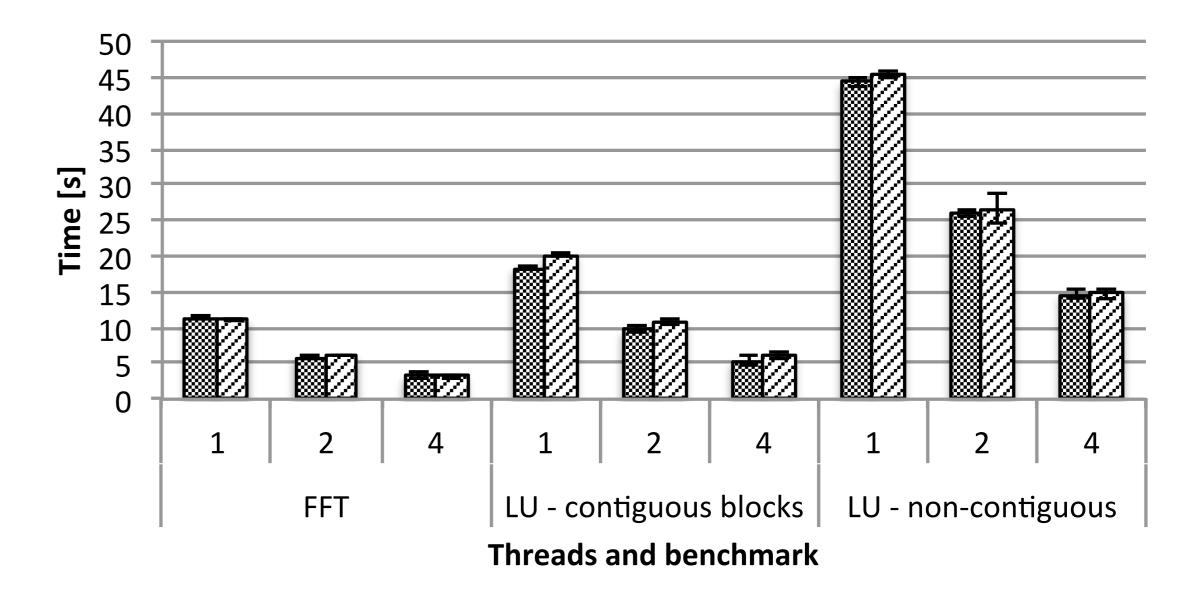

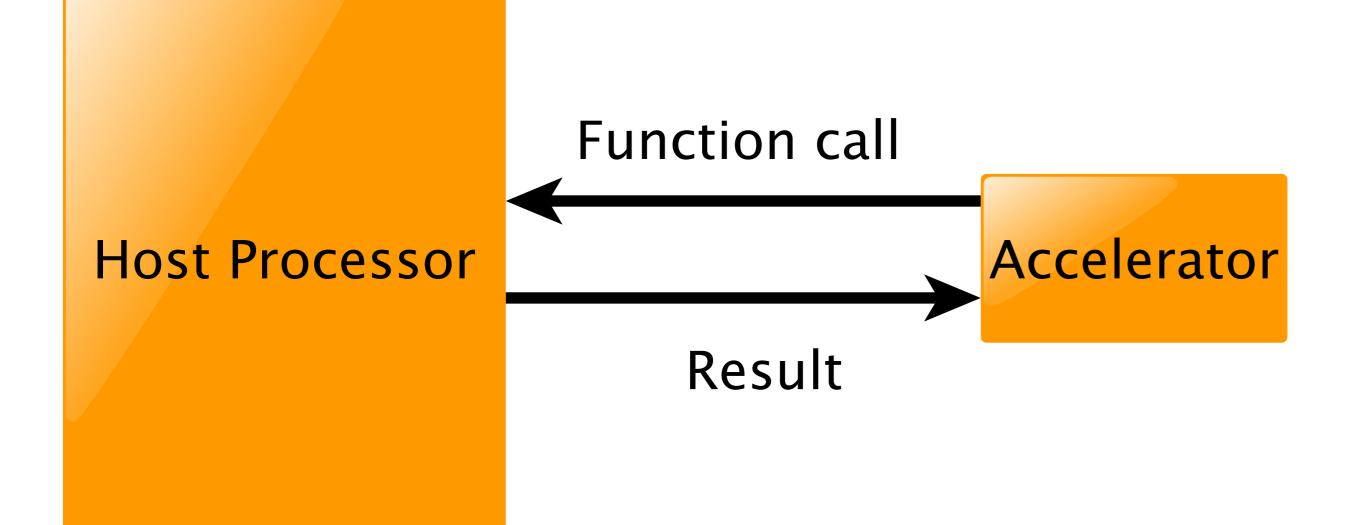

Figure : Execution time and speed up for increasing number of cores on x86-64.

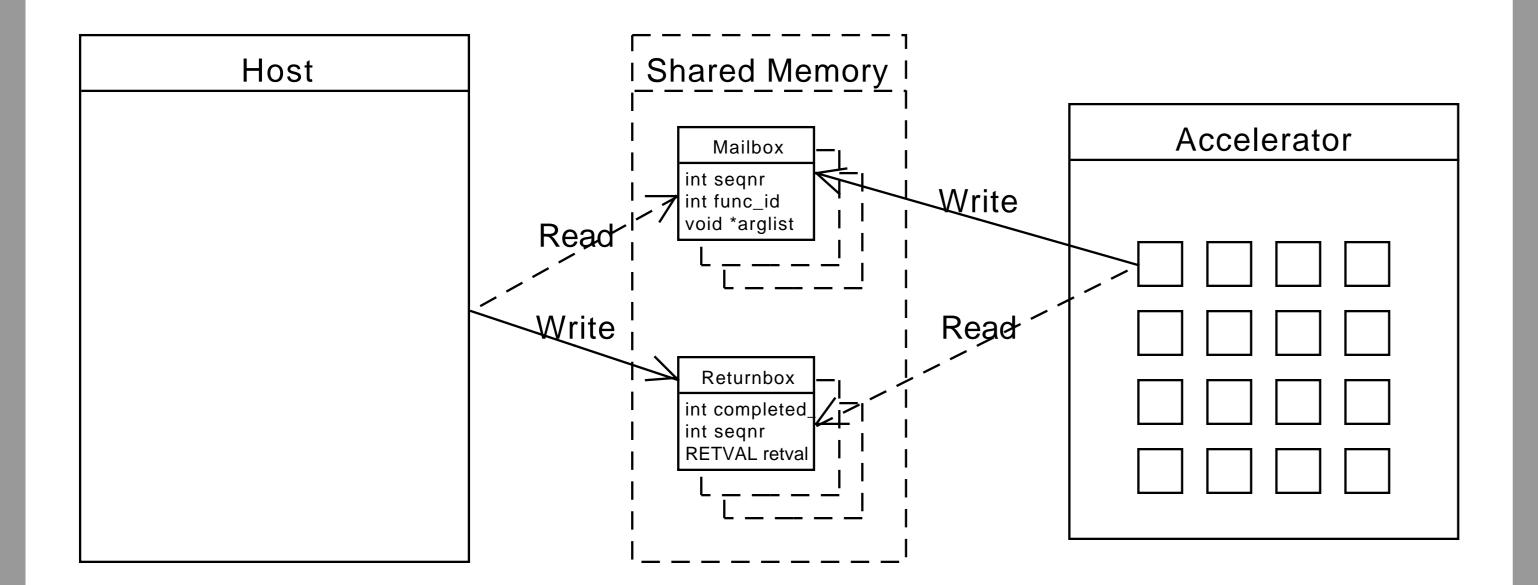

Object code sizes and savings

C library function (syn	n) Size (bytes)	FFT	LU
printf_fp	9345	Х	Х
sin_sse2	8569	Х	
cos_sse2	5159	Х	

Figure : System architecture

- main()/master thread executes on accelerator
- Decisions on spawning parallelism taken locally
 - ► fast, low latency
- Accelerator may invoke host
 - Complex decisions or function calls (C library)
- ► Host assists accelerator, not vice versa

Total		35044	22115
(the rest)		271	565
malloc	333	Х	Х
memset_sse2	2705		Х
_int_free	2796		
_int_malloc	4776	Х	Х
_getopt_internal_r	4391	Х	Х

Accelerator runtime object code size

Accelerator component	x86-64 (bytes)	Epiphany (bytes)
Host interface	209	96
Locks, Barriers	159	178
Misc	130	228
Bootstrap/Initialization	202	138
Thread creation	49	0
Total	749	640

Conclusions

► Object code reduction of 66-75% on benchmarks by offloading C library

Figure : Mailboxes in shared memory

- Host and accelerator communicate through shared memory
- Mailbox data structures used for communication
- Encode function call identity, arguments, and results

Acknowledgments

This work was funded by the European Artemis project nr. 295440, Portable and Predictable Performance on Heterogeneous Manycores (PaPP)

- ► Low runtime footprint of 750 bytes (x86-64), 640 bytes (Epiphany)
- Computational code not influenced by remote function call overhead Performance comparable to GNU libgomp
- Initialization is single threaded. FFT initialization dominated by remote function call overhead (see paper for details)

Future work

- Parallella/Epiphany implementation soon to be released
- Careful memory management software caching techniques
