Human-Computer Interaction Series

Editors-in-chief

Desney Tan Microsoft Research, Redmond, WA, USA

Jean Vanderdonckt Louvain School of Management, Université catholique de Louvain, Louvain-La-Neuve, Belgium The Human–Computer Interaction Series, launched in 2004, publishes books that advance the science and technology of developing systems which are effective and satisfying for people in a wide variety of contexts. Titles focus on theoretical perspectives (such as formal approaches drawn from a variety of behavioural sciences), practical approaches (such as techniques for effectively integrating user needs in system development), and social issues (such as the determinants of utility, usability and acceptability).

HCI is a multidisciplinary field and focuses on the human aspects in the development of computer technology. As technology becomes increasingly more pervasive the need to take a human-centred approach in the design and development of computer-based systems becomes ever more important.

Titles published within the Human–Computer Interaction Series are included in Thomson Reuters' Book Citation Index, The DBLP Computer Science Bibliography and The HCI Bibliography.

Preface

A few years ago we started developing an application that would help Golfers Master a *perfect* golf swing by using an augmented biofeedback. We enthusiastically began our research, but soon found out that the literature in the area of biofeedback systems and applications is scattered across different research areas and domains. It was difficult to find books or articles relevant to the topics of our interest. A good deal of works was dealing only with a very narrow research topic or they were written as reviews and surveys. We did not find any works that would systematically and concisely discuss the research area of augmented biofeedback systems and applications; the area of our interest.

With the continuing research in this scientific area, we became aware that many of our research colleagues came across the same difficulties. An idea to write a book that systematically covers biomechanical branch of biofeedback systems was born. We made every effort to organize the content of this book systematically, clearly, concisely and in a way that reflects the most relevant topics in biomechanical biofeedback systems and applications from the view of engineers with expertise in signal processing, communication, and information technologies. The emphasis is on systems with augmented feedback and special attention is given to systems and applications that use technical equipment to provide concurrent feedback to the user.

The book starts with a relatively comprehensive introduction that tries to present the broad interdisciplinarity of this research area. Then its focus narrows to the explanation of biomechanical biofeedback, its systems, and its different implementation architectures. The second half of the book is dedicated to the applications of biofeedback systems in sport and rehabilitation. In connection to that we discuss some of the most notable problems regarding the performance limitations of the available technologies that are used in such systems. The last chapter is devoted to the detailed presentation of biomechanical biofeedback systems and applications developed and implemented by the authors of this book.

This book is intended for researchers who are interested in a systematic presentation and discussion of the most relevant and interesting topics of biomechanical biofeedback systems and applications. We sincerely hope that we succeeded in vi Preface

connecting the scattered pieces of knowledge about biofeedback systems and applications in a concise, well-organized, understandable, and readable text that fills the void in this research area.

Ljubljana, Slovenia July 2018 Anton Kos Anton Umek

Acknowledgements

We are very lucky, having such great wives and families, who have been patiently supporting and encouraging us during the long hours of writing of this book.

The book would have not been possible without the initial inspiration and continual support from Prof. Sašo Tomažič, who is actually *responsible* that our research interest turned toward biofeedback systems and applications.

The extensive research activities, which led to a considerable portion of this book's content, were in part supported by the Slovenian Research Agency within the research program *Algorithms and Optimization Methods in Telecommunications* (research core funding No. P2-0246).

Thank you all!
