Preface

The International Conference on Interactive Theorem Proving (ITP) is a premier venue for publishing research in the area of logical frameworks and interactive proof assistants. Its topics include both theoretical foundations and implementation aspects of the technology, as well as applications to verifying hardware and software systems to ensure their safety and security, and applications to the formal verification of mathematical results.

ITP grew out of TPHOLs conferences and ACL2 workshops that began in the early 1990s. Previous editions of ITP have taken place in Brasilia (Brazil), Nancy (France), Nanjing (China), Vienna (Austria), Rennes (France), Princeton (USA), Berg en Dal (The Netherlands), and Edinburgh (UK).

This ninth edition, ITP 2018, was part of the Federated Logic Conference (FLoC) 2018, and took place in Oxford, UK, during July 9–12, 2018. We thank the FLoC Organizing Committee for undertaking the Herculean task of planning and organizing the event.

In all, 55 regular papers and ten short papers were submitted to the conference. Each paper was reviewed by at least three people, either members of the Program Committee or external reviewers. The committee ultimately accepted 32 regular papers and five short papers.

ITP 2018 included memorial lectures in honor of Mike Gordon and Vladimir Voevodsky, two influential figures in interactive theorem proving who had passed away over the course of the previous year. John Harrison was invited to present the lecture for Gordon, and Daniel Grayson was invited to present the lecture for Voevodsky. In addition, Jean-Christophe Filliâtre was invited to present a third keynote talk.

The present volume collects all the scientific contributions to the conference as well as abstracts of the three keynote presentations. We are grateful to the members of the ITP Steering Committee for their guidance and advice, and especially grateful to our colleagues on the Program Committee and the external reviewers, whose careful reviews and thoughtful deliberations served to maintain the high quality of the conference. We extend our thanks to the authors of all submitted papers and the ITP community at large, without whom the conference would not exist.

Finally, we are grateful for Springer for once again publishing these proceedings as a volume in the LNCS series, and we thank the editorial team for the smooth interactions.

² Inria Saclay – Île-de-France, Orsay, F-91893

Jean-Christophe.Filliatre@lri.fr

Abstract. Among formal methods, the deductive verification approach consists in first building verification conditions and then resorting to traditional theorem proving. Most deductive verification tools involve a high degree of proof automation through the use of SMT solvers. Yet there may be a substantial part of interactive theorem proving in program verification, such as inserting logical cuts, ghost code, or inductive proofs via lemma functions. In this talk, I will show how the Why3 tool for deductive verification resembles more and more a traditional ITP, while stressing key differences between the two.

Keywords: Deductive verification · Theorem proving

Voevodsky's Work on Formalization of Proofs and the Foundations of Mathematics

Daniel R. Grayson

Abstract. A consistent thread running through the three decades of Voevodsky's work is the application of the ideas of homotopy theory in new and surprising ways, first to motives, and then to formalization of proofs and the foundations of mathematics. I will present the story of the latter development, focusing on the points of interest to mathematicians.

Mike Gordon: Tribute to a Pioneer in Theorem Proving and Formal Verification

John Harrison

Amazon Web Services
jrh013@gmail.com

Abstract. Prof. Michael J. C. Gordon, FRS was a great pioneer in both computer-aided formal verification and interactive theorem proving. His own work and that of his students helped to explore and map out these new fields and in particular the fruitful connections between them. His seminal HOL theorem prover not only gave rise to many successors and relatives, but was also the framework in which many new ideas and techniques in theorem proving and verification were explored for the first time. Mike's untimely death in August 2017 was a tragedy first and foremost for his family, but was felt as a shocking loss too by many of us who felt part of his extended family of friends, former students and colleagues throughout the world. Mike's intellectual example as well as his unassuming nature and personal kindness will always be something we treasure. In my talk here I will present an overall perspective on Mike's life and the whole arc of his intellectual career. I will also spend time looking ahead, for the research themes he helped to establish are still vital and exciting today in both academia and industry.
