Foreword

In recent years, progress in the analysis of business data by methods of data mining or machine learning has continued to be fast-paced. New computing paradigms like the map-reduce framework for fault tolerant large-scale distributed computing and the availability of vast computing resources without high setup costs through cloud computing now enable the analysis of sizes of data and complexities of models that have been unthinkable before. “Big Data”, “In Memory Analysis” and so forth are keywords describing these developments.

Accompanying this trend, a plethora of business applications based on data and derived analytic insights have been developed. Some business authors have coined the concept of “analytic enterprises”, whose key competitive advantage are not their products, services or customer base, but their analytic understanding and decision support facilities. Many, maybe most of these applications, serve immediate business goals such as increase in sales and thus could be counted towards the broad field of analytic marketing.

In his book, Cai-Nicolas Ziegler widens the scope to a much broader set of applications that aim to provide intelligence for many other aspects of companies, i.e., reputation of brands, the coverage of companies, products, or news events, and technological synergies between different units of large companies. At the same time the focus of these applications is on a much longer time frame for expecting pay-offs for investments in these types of analysis. The term “competitive strategic intelligence” very well describes this area of research.

For this type of analysis, evidence often is buried in complex data such as Web pages that mix relevant parts of text with lots of non-relevant information. Methods from different areas such as natural language processing, sentiment analysis, social network analysis, and, of course, machine learning, have to be adapted, developed and integrated to achieve these goals. As someone having many years of experience on both sides, the academic side and the business side, Cai-Nicolas Ziegler is the perfect candidate to translate between both spheres: to capture and describe relevant business problems, to boil them down to the analytical core problem involved, to solve this problem, as well as to translate the results back into the realm of business understanding.

This book provides the reader with a compact introduction into an exciting and complex field of research, starting with an overview of the basic methods and technologies, providing a summary of recent developments in this field, up to a sample of genuine research contributions for different problems and applications. This book could become a condensation point for researchers to start their own research from and for practitioners to get ideas about how to solve their own problems; to both ends it will serve a very good purpose.

Hildesheim,
November 2011

Lars Schmidt-Thieme

Preface

The textbook at hand aims to provide an introduction to the use of automated methods for gathering competitive strategic intelligence. Hereby, the text does not describe a singleton research discipline in its own right, such as machine learning or Web mining. It rather contemplates an application scenario, namely the gathering of knowledge that is of paramount importance to organizations, e.g., companies and corporations.

To this end, the book first summarizes the range of research disciplines that contribute to addressing the issue, extracting from each those grains that are of utmost relevance to the depicted application scope. Moreover, the book presents systems that put these techniques to practical use (e.g., reputation monitoring platforms) and takes an inductive approach to define the *gestalt* of “mining for competitive strategic intelligence” by selecting major use cases that are laid out and explained in detail. These pieces form the *first part* of the book.

Each of those use cases is backed by a number of research papers, some of which are contained in its largely original version in the *second part* of the monograph. So, the book’s structure is organized into three layers, with increasing detail: The first layer describes the foundations, the second lays out the use cases in a summarizing fashion, and the third then exposes the inner nucleus of these cases.

Most parts of the content have been drawn from the “Habilitationsschrift” (thesis for the post-doctoral lecture qualification) of the author. Some chapters have been significantly expanded while some papers from the original thesis have been left out in order to only include the ones that are seminal to the given context. Hereby, the contributions presented encompass more than five years of research work at various institutions, both in academia and industry.

Why dedicating a monograph to the topic of “mining for strategic competitive intelligence”, the reader may ask? The rationale can be found in the evolution of the World Wide Web:

With the emergence of the so-called “Web 2.0”, the participation age has begun to flourish on the Internet: Everybody is able to overtly express his opinion in newsgroups and weblogs, which are best described as personal diaries open to the public. And these weblogs are being read by millions of others. Moreover, people contribute

side by side to the creation of massive knowledge structures like Wikipedia or ODP, the Open Directory Project. These represent collective efforts that would not have been conceivable by mere individuals or smaller groups. As such, the Web 2.0 has levelled the ground for the rise of new large-scale information sources and structures. And these sources of consumer-generated, mainly unstructured data (i.e., text) offer fresh new opportunities to be exploited:

Taking a closer look at them is particularly worthwhile from a *corporate* perspective, aiming to use its lush sprinkle in order to distill knowledge of strategic value for any given corporation or product. “Strategic knowledge” hereby refers to knowledge that can be utilized to obtain a better competitive position, e.g., by being able to more accurately target campaigns, or by receiving market feedback on new products more quickly so that product issues can be eradicated faster.

While these strategic insights were gathered before the advent of Web 2.0 already, they could not be gathered in an *automated* fashion. There was market research manually performed by people, there were surveys, opinion polls, and the like. Now it can be done at virtually no cost per unit. The information is out there – information generated by all of us – in a format digestible by machines. Here is the brave new world.

Acknowledgements

The core of research presented in this thesis has been conducted between 2005 and 2009, mainly during my post-Ph.D. time at the database group of the University of Freiburg, and (to the larger extent) during my tenure at Siemens Corporate Technology in Munich, the company's forefront research facility.

Before all, I wish to express my gratitude and thankfulness to Prof. Dr. Georg Lausen, whom I know since my days as Ph.D. student in Freiburg. He has supported me in my endeavor to write the thesis forming the foundation of this monograph – even beyond my university tenure – and has been much more to me than a mere supervisor. I value him also for his exceptional interpersonal skills and his trust in me. Moreover, I would like to thank my second supervisor, Prof. Dr. Georg Gottlob, whom I came to know through the Lixto project. Lixto is one of the best examples how university research can be turned into applicable practice.

I am also indebted to Hermann Friedrich, my former department head at Siemens AG Corporate Technology, Information & Communications, Knowledge Management (department names are long at Siemens): He gave me all the freedom of research I could think of and embraced my desire to keep on publishing in academic journals and conferences.

The coauthors of my research likewise deserve mentioning, namely Dr. Kai Simon (Averbis GmbH), Dr. Maximilian Viermetz, Dr. Stefan Jung, Michal Skubacz, Walter Kammergruber (all four at Siemens Corporate Technology), Christian Vögele (Telefónica O2), and Prof. Dr. Dietmar Seipel (University of Würzburg). Their input and discussions have been valuable and helped to shape my research's direction.

And, of course, there is my family, my parents Angelika & Klaus as well as my brother Chris, to whom I owe more than fits between the covers of this book. The list would not be complete without Miriam, in the same fashion as I would not be complete without her. She is my life.

To Miriam
