Foreword

Information seeking is a term that describes a collection of fundamental human processes that enable survival and growth. Some elements of information seeking are involuntary and continuous elements of consciousness, but most studies of information seeking focus on conscious processes that tend to be grouped under the name 'search'. In the 20th century, industrialization led to an informated society, which in turn has made search for information one of the basic skills of 21st century modernity. Information work is seldom solitary and most information is selectively shared at different stages of the information life cycle. Not only do people collaborate to create or analyze information, but they often collaborate on the seeking processes. This book focuses on theory, systems, and evaluation for the evolving study of collaborative information seeking.

Research and development in the information, library, and computer science domains led to great advances in search services. Today, the easy cases of search are well-served by search engines, e.g., known item searches, single facet searches, and searches for pointers to content. If the answer to a question can be expressed by a single info object (e.g., a page, a figure) then search engines can find that object. What remains problematic for these cases are assessing the veracity of the source and the appropriate interpretation and the use of information objects. However, there is much research to be done on search for open-ended, exploratory problems where answers require many information objects and points of view. The answer to a thesis question, which medical treatment strategy to select, how to invest for your retirement, which university to attend, the effects of social media on adolescent behavior, or similar questions, require people to invest more time, marshal more systems and services, and orchestrate the interaction of multiple subprocesses. Increasingly, the actions of other people add new dimensions to the multiple steps associated with multi-session, collaborative information seeking. This kind of information seeking requires a lot more support than current search engines provide.

The subtleties of human-information interaction done alone are complex: mapping needs to words (query tokens or displayed menu metadata), managing information tools and services, scanning candidate result snippets to evaluate whether to invest further examination, consuming documents to assess relevance and construct

viii Foreword

meaning, synthesizing these assessments over multiple consumptions to reach some conclusion or decision, and monitoring the process over perhaps long time intervals. Doing these activities with other people introduces possibilities for improved effectiveness but adds considerable collaborative load costs to share, achieve mutual understanding, form consensus, and monitor or document the collaborative information seeking process. We are only beginning to understand the tradeoffs that accrue between effectiveness and efficiency as people increasingly are able to seek information together. In this volume, Chirag Shah provides both a framework for thinking about and studying collaborative information seeking, and a roadmap for building systems that improve both effectiveness and efficiency.

Chapel Hill, NC, USA

Gary Marchionini

Preface

We live in a society where information is, without a doubt, a powerful force. This statement may sound like a cliche, but it always amazes me how often we forget. May be that's the purpose (or should be) of the technology that surrounds such information. The other aspect of information technology that amazes me is the fact that it is so new, considering human history. The clock that tells us the precise time of the day dates back only to the sixteenth century. The base 10 numbering system is only 500 years old, and mechanical devices used to calculate and present information have existed for only a couple of centuries. Of course, today when we say "information technology", we are probably thinking about computers and other digital devices, and they are merely a few decades old.

What intrigues me the most is how we have been able to integrate such new concepts and technologies with long-standing human behavior. Take for example, working in groups and living as a society. This behavior has proven to be extremely important for the survival and prosperity of our species. Back in the days of hunting together to today's office work, mankind has understood the need to work and thrive together. It is this behavior—the one of collaborating with each other—that has made it possible to achieve great feats in the history. How else can one man (or woman)¹ build the pyramids² or crack the human genetics code.

Of course, not all problems call for people working together. While Einstein had help and drew inspirations from others, he did come up with many significant findings himself. Leonardo de Vinci and Picasso, similarly, worked alone. Claude Shannon, considered to be the father of digital information age, was known to have worked in solitude behind closed doors. But let's put geniuses aside and talk about the remaining 99.99 % of us (which of course, still includes a lot of smart people). We do, often need to work in collaboration. I'm sure even Einstein needed help placing his furniture in his Princeton house; he was a genius, not a superhuman!

 $^{^1\}Gamma$ m not going to worry about being politically correct in this book and assume that the savvy reader understands he or she being equal.

²Though the ancient Egyptian workers were forced to work on pyramid construction on such "forced collaboration". More on this later.

x Preface

This book is about those times when people work in collaboration—an eternal human behavior, in the light of new and innovative technologies in the information age that we live in. More precisely, it is concerned about situations pertaining to information retrieval/seeking/sense-making where people are collaborating or should be collaborating.

One may ask—Why this book? Why now? There is a simple two-fold answer to both these questions. Using technology to understand and support collaborative behavior has been around for a while—what is known as Computer-Supported Cooperative Work (CSCW), but it is in the recent years that we have seen more specialized attention given to applying CSCW methods and frameworks for information seeking situations. On the other hand, the field of Information Retrieval (IR, or broadly speaking IS, information seeking) has found (or re-realized) the importance of considering social and collaborative aspects of search, synthesis, and information use.

This has led to a newly developed interest in the field that is still emerging at the intersection of several other well-established fields, including CSCW, IR, HCI, and social media/networking. This book as an attempt to introduce the relatively young domain of collaborative information seeking (CIS) research by discussing how it came to be, what it currently offers, and where it is headed next. The best part is that we all get to define and contribute to this future.

Personally, my journey on this path started during the summer of 2007 when I was an intern at FXPAL, working with Gene Golovchinsky and Jeremy Pickens. Back then, we worked on something called Collaborative Exploratory Search (CES), and argued that IR systems need to have "smart" components that could mediate collaborative activities and produce results that are "better" than any individual IR process, and we succeeded with at least one kind of situation (time-limited, recalloriented task with two people collaborating under assumed roles). We did continue this work further by identifying more situations and defining other roles, but as I returned to UNC and resumed working on my dissertation, I started moving in the direction of user-mediated collaboration. My dissertation provided a framework (among other things) for studying and supporting user-focused CIS. I have carried on working on various aspects of CIS (both user and system sides) as a faculty at Rutgers University. In the meantime, I have also participated in a number of professional events around CIS, including half a dozen workshops—two of which I co-organized.

This book is a culmination of all of these experiences, and while they have made me biased on the topic, I have tried my best to include others' views as well. In the end, my hope is that those working in this domain, and the larger field of IR see this book as a record of modern day CIS research that has tried to incorporate many view-points and contributions to inform those looking for a comprehensive treatment of this topic, along with the wonderful opportunities (and challenges) it presents.

Acknowledgements

I would like to thank all of the following people and organizations for their contributions to my research relating to this book. Without them, this work would not exist.

- Gene Golovchinsky and Jeremy Pickens at FXPAL, California, for introducing me to the area of collaborative exploratory search during my internship in summer 2007.
- The National Science Foundation, for funding my dissertation studies and research with IIS grant # 0812363.
- Yahoo! for providing funding for the development of Coagmento through Campus Innovation Award (2011–2012).
- Rutgers University PhD students Roberto Gonzalez-Ibanez and Muge Haseki, who have not only been working with me on various issues of collaborative information seeking (CIS), but also contributed to parts of this book. Specifically, Roberto wrote a section on affective dimension of CIS, and Muge did Appendix D on computer-mediated communication (CMC).
- My PhD advisor Gary Marchionini, for his constant encouragement and guidance
 on all of my scholarly endeavors at UNC. Without his kindness, support, and
 trust in my work, I could not have been able to even embark upon this journey
 presented here.
- The rest of my dissertation committee—Diane Kelly, Barbara Wildemuth, and late Deborah Barreau from UNC Chapel Hill, and Susan Dumais from Microsoft Research.
- My colleagues at Rutgers University, especially Nick Belkin, Paul Kantor, Michael Lesk, Marie Radford, and Mark Aakhus who enriched my understanding of CIS and the fields of information and communication through many conversations and mentoring sessions.
- A number of external advisors who have either commented on different drafts
 of my work (articles, proposals, this manuscript) or had very helpful discussions
 with me on this topic—Madhu Reddy from Penn State; Michael Twidale from
 UIUC; Rob Capra from UNC Chapel Hill; Jonathan Foster from University of
 Sheffield; Preben Hansen from Swedish Institute of Computer Science; Susan

xii Acknowledgements

Dumais, Merrie Morris, Ryen White, Paul Bennett, and Jaime Teevan from Microsoft Research; and Dan Russell and Ed Chi from Google.

- My late father Rajendrakumar, mother Sneha, and sister Shweta, for their constant love, kindness, and support, even when they are all in different continents.
- And last, but not the least, my wife Lori, for being absolutely supportive of my research and sacrificing her time with me so that I could work on this book. Even in the darkest hour of toil and frustration, she had faith in me and my efforts. Lori also provided valuable feedback on early drafts of this book, as well as beta versions of Coagmento. Without her, this work could not have been possible.
