Preface

Embedded systems have long become an essential part of our everyday life. They control essential features in our cars, such as airbags, braking systems, or power locks, and are used to manage our steadily increasing communication needs by means of Internet routers or cell phones. Embedded systems are essential in application areas where human control is impossible or infeasible, such as adjusting the control surfaces of aircraft or controlling a chemical reaction inside a power plant. The embedded systems industry has therefore become a multibillion euro industry.

*Embedded systems
— opportunities and
challenges*

The development of modern embedded systems is becoming increasingly difficult and challenging. Issues that greatly impact their development include the increase in the overall system complexity, their tighter and cross-functional integration, the increasing requirements concerning safety and real-time behavior, the need to reduce development and operation costs, as well as the need for shorter time-to-market.

Many research contributions and development methods aim to address these challenges, and theories for the seamless development of embedded systems have been proposed. However, these solutions address only a small subset of the above-mentioned problems, are only applicable in very specific settings, and lack an appropriate cross-domain validation in representative industrial settings.

*Need for an integrated
development
approach*

The mission of the Software Platform Embedded Systems 2020 (SPES 2020) project was thus to focus on the professionalization of a cross-domain, model-based development method for embedded systems. SPES 2020 is an innovation alliance project sponsored by the German Federal Ministry of Education and Research. In SPES 2020, 21 partners from academia and industry have joined forces in order to develop a modeling framework that is based on the latest state-of-the-art in embedded systems engineering, addresses specific development challenges, and is validated in different domains to ensure its applicability in industrial embedded systems development.

Aim of this book

*Industry challenges,
principles, and
application*

The purpose of this book is to present an overview of the SPES modeling framework and to demonstrate its applicability to embedded system development in various representative industry domains. The book provides a comprehensive explanation of the basic solution concepts of the SPES modeling framework and illustrates the application of these concepts in five application domains (automation, automotive, avionics, energy, and healthcare). The book summarizes the lessons learned, outlines evaluation results, and describes how the SPES 2020 modeling framework can be tailored to meet domain-specific and project-specific needs.

Target audience

*Researchers,
practitioners, and
consultants*

This book is aimed at professionals and practitioners who deal with the development of embedded systems on a daily basis. This includes developers, requirements engineers, software or hardware architects, business analysts, mechatronics experts, safety engineers, testers, and certifiers. It serves as a compendium for researchers in the field of software engineering and embedded systems, regardless of whether you are working for a research division of a company or are employed with a university or academic research institute. For teachers and consultants, it provides a sound foundation in the basic relationships and solution concepts for engineering embedded systems and illustrates how these principles and concepts can be applied in practice.

Content of this book

This book is structured into four parts and 18 chapters:

*Status quo and
industry requirements*

❑ *Part I – Starting Point:* This part discusses the status quo of embedded system development and model-based engineering and summarizes the key requirements faced when developing embedded systems in different application domains. Chapter 1 gives detailed insight into the role of embedded systems and outlines the scope of the SPES 2020 project. Chapter 2 discusses and summarizes the requirements for the development of future embedded system development in the automation, automotive, avionics, energy, and healthcare application domains.

*The SPES modeling
framework and its
viewpoints*

❑ *Part II – The SPES modeling framework:* This part describes the backbone of SPES 2020 — the SPES modeling framework. Chapter 3 derives the core principles of the SPES 2020 modeling framework and illustrates how these principles help in fulfilling the

requirements outlined in Chapter 2. It outlines the overall SPES modeling framework and describes the basic solution concepts of the SPES 2020 abstraction layers and viewpoints. Subsequently, Chapters 4 through 7 describe the requirements, functional, logical, and technical viewpoints of the SPES modeling framework. Each chapter defines the specific engineering artifacts subsumed by the viewpoint, outlines the basic relationships of those artifacts with the other viewpoints, and describes the engineering process across the basic abstraction layers. Chapters 8 and 9 describe how the SPES modeling framework addresses the crosscutting aspects “safety” and “real-time.”

- ❑ *Part III – Application and Evaluation of the SPES Modeling Framework:* This part describes the validation steps taken to ensure that the requirements outlined in Chapter 2 are met by the solution concepts proposed in Part II. Chapter 10 outlines the overall evaluation strategy used to assess the applicability of the SPES modeling framework. Chapters 11 through 15 describe the use of the SPES modeling framework in the five application domains automation, automotive, avionics, energy, and healthcare. Each of these chapters briefly characterizes the specifics of the application domain and shows how the SPES modeling framework can be tailored with regard to these characteristics. In addition, each chapter outlines the evaluation activities conducted in the application domain by various partners and summarizes the key evaluation results. Chapter 16 summarizes the overall evaluation results and discusses them in the context of the requirements outlined in Chapter 2 and the SPES principles described in Chapter 3.

Evaluation strategy
and application details
- ❑ *Part IV – Impact of the SPES Modeling Framework:* This part assesses the impact of the SPES modeling framework. Chapter 17 summarizes the key lessons learned in SPES 2020. Chapter 18 concludes this book by providing insights into open challenges for the engineering of software-intensive embedded systems.

Achieved results and
future work

For further reading, a list of relevant, advanced literature providing deeper insights is given at the end of each chapter.

Acknowledgements

There are many people who have contributed significantly to this book.

Firstly, we would like to thank the members of the Steering Committee of the SPES 2020 project for their guidance and support

throughout the entire project and for encouraging us to document the project results in this book.

Secondly, we would like to thank Ottmar Bender, Dr. Wolfgang Böhm, Dr. Martin Feilkas, Peter Heidl, Dr. Stefan Henkler, Dr. Ulrich Löwen, Andreas Vogelsang, and Dr. Thorsten Weyer for their relentless efforts in integrating the different project activities that took place concurrently, for many fruitful discussions and suggestions, and for their critical reviews of project milestones. Much of the content of this book is a result of their devotion and attention to detail.

Thirdly, we would like to thank each and every author of the individual chapters for their patience in the book writing process, their willingness to revise their chapters time after time, and their cooperation and help in making this book a consistent and integrated product.

Last but not least, we would like to express our deepest thanks to Bastian Tenbergen and Dr. Thorsten Weyer for their tremendous effort and support in the overall editing process.

The results presented in this book have been made possible through the funding received from the Federal Ministry of Education and Research (BMBF) of the Federal Republic of Germany under grant number 01IS08045. In particular, we would like to thank Prof. Dr. Wolf-Dieter Lukas, Dr. Erasmus Landvogt, and Ingo Ruhmann (all with the BMBF). In addition, we would like to thank Dr. Michael Weber of the German Aerospace Center (DLR) for supporting this project.

Furthermore, we would like to thank Tracey Duffy for her valuable language editing assistance and Ralf Gerstner from Springer for his continuous support in publishing this book.

Summer 2012

Table of Contents

Part I Starting Situation	1
1 Challenges in Engineering for Software-Intensive Embedded Systems.....	3
1.1 Core Value of Embedded Systems Development	4
1.2 The Future of Embedded Systems	5
1.3 Vision of SPES 2020	8
1.4 Mission of SPES 2020.....	9
1.5 Research Approach.....	11
1.6 Topics Not Addressed in SPES 2020.....	14
1.7 References	14
2 Requirements from the Application Domains	15
2.1 Initial Situation in the Application Domains	16
2.2 Requirements for the SPES Engineering Approach.....	20
2.3 General Requirements from Industry.....	25
2.4 References	28
Part II The SPES Modeling Framework	29
3 Introduction to the SPES Modeling Framework	31
3.1 Motivation for the SPES Modeling Framework	32
3.2 Characteristics of Software-Intensive Embedded Systems	32
3.3 The Principles of the SPES Modeling Framework	34
3.4 Core Concepts of the SPES Modeling Framework.....	35
3.5 The SPES Modeling Framework	36
3.6 Underlying Modeling Theories.....	46
3.7 Overview of the Following Chapters	47
3.8 References	48
4 Requirements Viewpoint.....	51
4.1 Introduction to the Requirements Viewpoint.....	52
4.2 Requirements Artifacts	53
4.3 Integration in the SPES Modeling Framework	63
4.4 The Requirements Process Model across Abstraction Layers	66
4.5 References	67
4.6 Acknowledgements.....	68
5 Functional Viewpoint.....	69
5.1 Introduction	70

5.2	Concerns	71
5.3	Functional Black Box Model	72
5.4	Functional White Box Model	75
5.5	Analyses	77
5.6	Integration in the SPES Modeling Framework	78
5.7	The Functional Viewpoint Process	80
5.8	References	82
6	Logical Viewpoint	85
6.1	Introduction	86
6.2	Concerns	86
6.3	Logical Component Architecture	88
6.4	Analyses	89
6.5	Integration in the SPES Modeling Framework	90
6.6	The Logical Viewpoint Process	91
6.7	References	93
7	Technical Viewpoint	95
7.1	Introduction	96
7.2	Metamodel of the Technical Viewpoint	97
7.3	Mapping between Viewpoints and Abstraction Layers	103
7.4	How to Get from the Logical to the Technical Viewpoint	105
7.5	References	106
8	Modeling Quality Aspects: Safety	107
8.1	Introduction	108
8.2	Concerns	108
8.3	Component-Integrated Component Fault Trees	109
8.4	Efficiently Deploying Safety-Relevant Applications to Integrated Architectures	112
8.5	Integration in the SPES Modeling Framework	117
8.6	References	118
9	Modeling Quality Aspects: Real-Time	119
9.1	Introduction	120
9.2	Model-Based Real-Time Engineering	121
9.3	Modeling Platform-Independent Real-Time Requirements	122
9.4	Modeling Platform-Specific Real-Time Properties	124
9.5	Schedulability Analysis	127
9.6	References	128
Part III Application and Evaluation of the SPES Modeling Framework		129
10	Overview of the SPES Evaluation Strategy	131

10.1	SPES 2020 Evaluation Strategy	132
10.2	Selecting Appropriate Case Studies	133
