#### Abstract

The Induced Minor problem is that of testing whether a graph $G$ can be modified into a graph $H$ by a sequence of vertex deletions and edge contractions. If only edge contractions are permitted, we obtain the Contractibility problem. We prove that Induced Minor is polynomial-time solvable when $G$ is AT-free and $H$ is fixed, i.e., not part of the input. In addition, we show that Contractiblity is polynomialtime solvable when $G$ is AT-free and $H$ is a fixed triangle-free graph. We complement these two results by proving that both problems are W[1]-hard on AT-free graphs when parameterized by $\left|V_{H}\right|$.

## 1 Introduction

In this paper we study graph containment problems. Whether or not a graph contains some other graph depends on the notion of containment used. In the literature several natural definitions have been studied such as containing a graph as a contraction, dissolution, immersion, (induced) minor, (induced) topological minor, (induced) subgraph, or (induced) spanning subgraph. We focus on the containment relations "induced minor" and "contraction". A graph $G$ contains a graph $H$ as an induced minor if $G$ can be modified into a graph $H$ by a sequence of vertex deletions and edge contractions. Here, the operation edge contraction removes the end-vertices $u$ and $v$ of an edge from $G$ and replaces them by a new vertex adjacent to precisely those vertices to which $u$ or $v$ were adjacent. A graph $G$ contains $H$ as a contraction if $H$ can be obtained from $G$ by edge contractions only. The decision problems that are to test whether a graph $H$ is an induced minor or a contraction of a graph $G$ are called Induced Minor and Contractibility, respectively. Both problems are known to be NP-complete even when $G$ and $H$ are trees of bounded diameter or trees, the vertices of which have degree at most 3 except for at most one vertex, as shown by Matoušek and Thomas [20]. It is therefore natural to fix the graph $H$ and to consider only

[^0]the graph $G$ to be part of the input. We denote these variants as $H$-Induced Minor and $H$-Contractibility, respectively.

The computational complexity classifications of $H$-Induced Minor and $H$ Contractibility are far from being settled, although both polynomial-time and NP-complete cases are known. In contrast, the two related problems H Minor and $H$-Topological Minor, which are to test whether a graph $G$ contains a graph $H$ as a minor or topological minor, respectively, can be solved in cubic time for any fixed graph $H$, as shown by Robertson and Seymour [22] and Grohe, Kawarabayashi, Marx, and Wollan [11], respectively. For $H$-Induced Minor, Fellows, Kratochvíl, Middendorf, and Pfeiffer [7] showed that there exists a graph $H$ for which the problem is NP-complete. This specific graph $H$ has 68 vertices and is yet the smallest $H$ for which $H$-Induced Minor is known to be NP-complete. The question whether $H$-Induced Minor is polynomial-time solvable for any fixed tree $H$ was posed as an open problem at the AMS-IMSSIAM Joint Summer Research Conference on Graph Minors in 1991. So far this question could only be answered for trees on at most seven vertices except for one case [8]. Brouwer and Veldman [2] showed that $H$-Contractibility is NPcomplete when $H$ is a path or a cycle on four vertices. Other polynomial-time solvable and NP-complete cases, depending on $H$, can be found in [12, 18, 19].

Due to the notorious difficulty of solving $H$-Induced Minor and $H$ Contractibility for general graphs, the input has been restricted to special graph classes. Fellows, Kratochvíl, Middendorf, and Pfeiffer [7] showed that for every fixed graph $H$, the $H$-Induced Minor problem can be solved in linear time on planar graphs. Van 't Hof et al. [12] extended this result by proving that for every fixed planar graph $H$, the $H$-Induced Minor problem is linear-time solvable on any minor-closed graph class not containing all graphs. Kamiński and Thilikos [14] showed that $H$-Contractibility can be solved in cubic time for graphs of bounded genus. Belmonte et al. [1] showed that for every fixed graph $H$, the $H$-Induced Minor and $H$-Contractibility problems are polynomialtime solvable for chordal graphs. The $H$-Contractibility problem has also been studied for claw-free graphs, but only partial results are known for this graph class [9].

We consider $H$-Induced Minor and $H$-Contractibilty restricted to the class of asteroidal triple-free graphs, also known as AT-free graphs. An asteroidal triple is a set of three mutually non-adjacent vertices such that each two of them are joined by a path that avoids the neighborhood of the third, and AT-free graphs are exactly those graphs that contain no such triple. AT-free graphs, defined fifty years ago by Lekkerkerker and Boland [17], are well studied in the literature and contain many well-known classes, e.g., cobipartite graphs, cocomparability graphs, cographs, interval graphs, permutation graphs, and trapezoid graphs (cf. [3]). All these graph classes have geometric intersection models being extremely useful when designing polynomial-time algorithms for hard problems. No such model is available for AT-free graphs. Recently, Golovach, Paulusma and Van Leeuwen [10] showed that the $H$-Induced Topological Minor problem is polynomial-time solvable on AT-free graphs for every fixed $H$. This problem
is to test if a graph $G$ can be modified into a graph $H$ by a sequence of vertex deletions and vertex dissolutions. The latter graph operation is the contraction of an edge incident to a degree-two vertex that is not in a triangle (cycle on three vertices). The same authors [10] also showed that this problem is $\mathrm{W}[1]$-hard when parameterized by $\left|V_{H}\right|$.

Our Results. We show that $H$-Induced Minor can be solved in polynomial time on AT-free graphs for any fixed graph $H$. Consequently, on AT-free graphs, all four problems $H$-Minor, $H$-Induced Minor, $H$-Topological Minor and $H$-Induced Topological Minor are polynomial-time solvable for any fixed graph $H$. For $H$-Contractibility, we prove that the problem can be solved in polynomial time on AT-free graphs for any fixed graph $H$ that is triangle-free. We complement these results by proving that that Induced Minor and Contractibilty is $\mathrm{W}[1]$-hard when parameterized by $\left|V_{H}\right|$. This result indicates that we cannot expect to obtain FPT algorithms for these two problems, i.e., that run in time $f(|V(H)|)|V(G)|^{O(1)}$ unless $\mathrm{FPT}=\mathrm{W}[1]$, which is considered to be unlikely [6]. Our $W[1]$-hardness proofs also show that Induced Minor and Contractibility are NP-complete for AT-free graphs; these results were not known before.

The celebrated result by Robertson and Seymour that $H$-Minor is FPT on general graphs [22] is closely connected to the fact that $k$-Disjoint Paths is FPT with parameter $k$. To solve $H$-Induced Topological Minor on AT-free graphs, Golovach et al. [10] considered the variant $k$-Induced Disjoint Paths, in which the paths must not only be vertex-disjoint but also mutually induced, i.e., edges between vertices of any two distinct paths are forbidden. Here we must consider another variant, which was introduced by Belmonte et al. [1]. A terminal pair in a graph $G=(V, E)$ is a specified pair of vertices $s$ and $t$ called terminals, and the domain of a terminal pair $(s, t)$ is a specified subset $U \subseteq V$ containing both $s$ and $t$. We say that two paths, each of which is between some terminal pair, are vertex-disjoint if they have no common vertices except possibly the vertices of the terminal pairs. This leads to the following decision problem, which is NP-complete on general graphs even when $k=2[1]$.

## Set-Restricted $k$-Disjoint Paths

Instance: a graph $G$, terminal pairs $\left(s_{1}, t_{1}\right), \ldots,\left(s_{k}, t_{k}\right)$, and domains $U_{1}, \ldots, U_{k}$. Question: does $G$ contain $k$ mutually vertex-disjoint paths $P_{1}, \ldots, P_{k}$ such that $P_{i}$ is a path from $s_{i}$ to $t_{i}$ using only vertices from $U_{i}$ for $i=1, \ldots, k$ ?

Note that the domains $U_{1}, \ldots, U_{k}$ are not necessarily pairwise disjoint. If we let every domain contain all vertices of $G$, we obtain exactly the Disjoint Paths problem. We give an algorithm that solves Set-Restricted $k$-Disjoint Paths in polynomial time on AT-free graphs for any fixed integer $k$. We then use this algorithm as a subroutine in our polynomial-time algorithms for $H$-Induced Minor and $H$-Contractibility. We emphasize that we can not apply the algorithm for $k$-Induced Disjoint Paths on AT-free graphs [10] as a subroutine for solving $H$-Induced Minor on AT-free graphs. The techniques used in that algorithm are quite different from the techniques we use here to solve SET-

Restricted $k$-Disjoint Paths on AT-free graphs. Moreover, when $k$ is in the input, $k$-Induced Disjoint Paths and Set-Restricted $k$-Disjoint Paths have a different complexity for AT-free graphs. Golovach et al. [10] proved that in that case $k$-Induced Disjoint Paths is polynomial-time solvable for ATfree graphs, whereas $k$-Disjoint Paths, and consequently Set-Restricted $k$ Disjoint Paths, are already NP-complete for interval graphs [21], which form a subclass of AT-free graphs.

We use our algorithm for solving Set-Restricted $k$-Disjoint Paths to obtain one additional results on AT-free graphs. We show that we can solve the problem Set-Restricted $k$-Disjoint Connected Subgraphs, also introduced by Belmonte et al. [1], in polynomial time on AT-free graphs for any fixed integer $k$. A terminal set in a graph $G=(V, E)$ is a specified subset $S_{i} \subseteq V$.

## Set-Restricted $k$-Disjoint Connected Subgraphs

Instance: a graph $G$, terminal sets $S_{1}, \ldots, S_{k}$, and domains $U_{1}, \ldots, U_{k}$.
Question: does $G$ have $k$ pairwise vertex-disjoint connected subgraphs $G_{1}, \ldots, G_{k}$, such that $S_{i} \subseteq V_{G_{i}} \subseteq U_{i}$, for $1 \leq i \leq k ?$
If $\left|S_{i}\right|=2$ for all $1 \leq i \leq k$, then we obtain the SET-Restricted $k$-Disjoint Paths problem. If $\bar{U}_{i}=V_{G}$ then we obtain the $k$-Disjoint Connected SubGRAPHS problem. The latter problem has been introduced by Robertson and Seymour [22] and is NP-complete on general graphs even when $k=2$ and $\min \left\{\left|Z_{1}\right|,\left|Z_{2}\right|\right\}=2[13]$.

## 2 Preliminaries

We only consider finite undirected graphs without loops and multiple edges. We refer to the textbook by Diestel [5] for any undefined graph terminology. Let $G$ be a graph. We denote the vertex set of $G$ by $V_{G}$ and the edge set by $E_{G}$. The subgraph of $G$ induced by a subset $U \subseteq V_{G}$ is denoted by $G[U]$. We say that $U \subseteq V_{G}$ is connected if $G[U]$ is a connected graph. The graph $G-U$ is the graph obtained from $G$ by removing all vertices in $U$. If $U=\{u\}$, we also write $G-u$. The open neighborhood of a vertex $u \in V_{G}$ is defined as $N_{G}(u)=\left\{v \mid u v \in E_{G}\right\}$, and its closed neighborhood is defined as $N_{G}[u]=N_{G}(u) \cup\{u\}$. For $U \subseteq V_{G}$, $N_{G}[U]=\cup_{u \in U} N_{G}[u]$. The degree of a vertex $u \in V_{G}$ is denoted $d_{G}(u)=\left|N_{G}(u)\right|$. The distance $\operatorname{dist}_{G}(u, v)$ between a pair of vertices $u$ and $v$ of $G$ is the number of edges of a shortest path between them. Two sets $U, U^{\prime} \subseteq V_{G}$ are called adjacent if there exist vertices $u \in U$ and $u^{\prime} \in U^{\prime}$ such that $u u^{\prime} \in E_{G}$. A set $U \subseteq V_{G}$ dominates a vertex $w$ if $w \in N_{G}[U]$, and $U$ dominates a set $W \subseteq V_{G}$ if $U$ dominates each vertex of $W$. In these two cases, we also say that $G[U]$ dominates $w$ or $W$, respectively. A set $U \subseteq V_{G}$ is a dominating set of $G$ if $U$ dominates $V_{G}$.

The graph $P=u_{1} \cdots u_{k}$ denotes the path with vertices $u_{1}, \ldots, u_{k}$ and edges $u_{i} u_{i+1}$ for $i=1, \ldots, k-1$. We also say that $P$ is a $\left(u_{1}, u_{k}\right)$-path. For a path $P$ with some specified end-vertex $s$, we write $x \prec_{s} y$ if $x \in V_{P}$ lies in $P$ between $s$ and $y \in V_{P}$; in this definition, we allow that $x=s$ or $x=y$. A pair of vertices $\{x, y\}$ is a dominating pair if the vertex set of every $(x, y)$-path is a
dominating set of $G$. Corneil, Olariu and Stewart [3, 4] proved the following structural theorem.

Theorem 1 ([3,4]). Every connected AT-free graph has a dominating pair and such a pair can be found in linear time.

Using these results, Kloks, Kratsch and Müller [15] gave the following tool for constructing dynamic programming algorithms on AT-free graphs. For a vertex $u$ of a graph $G$, we call the sets $L_{i}(u)=\left\{v \in V_{G} \mid \operatorname{dist}_{G}(u, v)=i\right\}(i \geq 1)$ the BFS-levels of $G$. Note that the BFS-levels of a vertex can be determined in linear time by the Breadth-First Search algorithm (BFS).

Theorem 2 ([15]). Every connected AT-free graph contains a dominating path $P=u_{0} \cdots u_{\ell}$ that can be found in linear time such that
(i) $\ell$ is the number of BFS-levels of $u_{0}$;
(ii) $u_{i} \in L_{i}\left(u_{0}\right)$ for $i=1, \ldots, \ell$;
(iii) each $z \in L_{i}\left(u_{0}\right)$ is adjacent to $u_{i-1}$ or to $u_{i}$ for all $1 \leq i \leq \ell$.

## 3 Set-Restricted Disjoint Paths and Connected Subgraphs

In this section we show that Set-Restricted $k$-Disjoint Paths and its generalization Set-Restricted $k$-Disjoint Connected Subgraphs can be solved in polynomial time on AT-free graphs for any fixed integer $k$. For SETRestricted $k$-Disjoint Paths, we first introduce some extra terminology and give a number of structural results. We then apply dynamic programming to solve this problem. Afterward, we solve Set-Restricted $k$-Disjoint Connected Subgraphs.

### 3.1 Structural Lemmas

Let $G$ be a graph, and let $W \subseteq V_{G}$. Consider an induced path $P$ in $G$. Then $V_{P} \cap W$ and $V_{P} \backslash W$ induce a collection of subpaths of $P$ called $W$-segments, or segments if no confusion is possible. Segments induced by $V_{P} \cap W$ are said to lie inside $W$, whereas segments induced by $V_{P} \backslash W$ lie outside $W$. We need the following two lemmas.

Lemma 1. Let $P$ be an induced path in an AT-free graph $G$. Let $U \subseteq V_{G}$ be connected. Then $P$ has at most three segments inside $N_{G}[U]$.

Proof. To obtain a contradiction, assume that $P$ has at least four segments inside $N_{G}[U]$. Then $P$ has three segments $P_{1}, P_{2}, P_{3}$ outside $N_{G}[U]$ such that for each $P_{i}$, both end-vertices of $P_{i}$ are adjacent to end-vertices of the segments inside $N_{G}[U]$. Let $s$ be an end-vertex of $P$, and let $x_{i}, y_{i}$ be the end-vertices of $P_{i}$ for $i \in$ $\{1,2,3\}$. Assume that $P_{1}, P_{2}, P_{3}$ and their end vertices are ordered in such a way that $x_{1} \prec_{s} y_{1} \prec_{s} x_{2} \prec_{s} y_{2} \prec_{s} x_{3} \prec_{s} y_{3}$. Let $z_{1}, z_{2} \in N_{G}[U], z_{1} \prec_{s} x_{1}, y_{3} \prec_{s} z_{2}$
be the vertices adjacent to $x_{1}$ and $y_{3}$, respectively in $P$. Let $z_{1}^{\prime}, z_{2}^{\prime} \in U$ be vertices adjacent to $z_{1}, z_{2}$, respectively. We claim that $x_{1}, x_{2}, x_{3}$ form an asteroidal triple. Since $x_{1}, x_{2}, x_{3}$ are vertices of different segments outside $N_{G}[U]$ and $P$ is an induced path, $x_{1}, x_{2}, x_{3}$ are distinct and pairwise non-adjacent. Because $P$ is an induced path, the $\left(x_{1}, x_{2}\right)$ and $\left(x_{2}, x_{3}\right)$-subpaths of $P$ avoid the neighborhoods of $x_{3}$ and $x_{1}$, respectively. Finally, the path obtained by the concatenation of the $\left(x_{1}, z_{1}\right)$-subpath of $P$, the path $z_{1} z_{1}^{\prime}$, a $\left(z_{1}^{\prime}, z_{2}^{\prime}\right)$-path in $G[U], z_{2}^{\prime} z_{2}$ and the $\left(z_{2}, x_{3}\right)$-subpath of $P$ avoids the the neighborhood of $x_{2}$, as $x_{2}$ is not adjacent to $z_{1}, z_{2}$ and $x_{2} \notin N_{G}[U]$. This gives us a contradiction.

Lemma 2. Let $P$ be an induced path in an AT-free graph $G$. Let $U \subseteq V_{G}$ be connected. Then every segment of $P$ outside $N_{G}[U]$ that contains no end-vertex of $P$ has at most two vertices.

Proof. To obtain a contradiction, assume that $P$ has a segment $P^{\prime}$ with endvertices $x, y$ such that $P^{\prime}$ has at least three vertices and $x, y$ have neighbors $x_{1}, y_{1}$ respectively in $P$, where $x_{1}, y_{1} \notin V_{P^{\prime}}$. Then $x_{1}, y_{1} \in N_{G}[U]$. Let $x_{2}, y_{2}$ be neighbors of $x_{1}, y_{1}$ in $U$. We claim that $x, y, x_{2}$ is an asteroidal triple. Clearly, $x, y, x_{2}$ are distinct and pairwise non-adjacent. The $(x, y)$-path $P^{\prime}$ avoids $N_{G}[U]$ and, therefore, $N_{G}\left[x_{2}\right]$. Because $P$ is an induced path, $x_{1}$ and $y_{1}$ are not adjacent, and they are not adjacent to $y$ and $x$ respectively. Hence $x x_{1} x_{2}$ avoids $N_{G}[y]$. It remains to observe that the path obtained by the concatenation of a $\left(x_{2}, y_{2}\right)$ path in $U$ and $y_{2} y_{1} u$ avoids $N_{G}[x]$.

The next lemma follows directly from the property of being induced.
Lemma 3. Let $u$ be a vertex of an induced path $P$ in a graph $G$. Then $P$ has one segment inside $N_{G}[u]$ and this segment has at most three vertices.

Let $G$ be a graph with terminal pairs $\left(s_{1}, t_{1}\right), \ldots\left(s_{k}, t_{k}\right)$ and corresponding domains $U_{1}, \ldots, U_{k}$. Let $\left\{P_{1}, \ldots, P_{k}\right\}$ be a set of mutually vertex-disjoint paths, such that $P_{i}$ is a path from $s_{i}$ to $t_{i}$ using only vertices from $U_{i}$ for $i=1, \ldots, k$. We say that $\left\{P_{1}, \ldots, P_{k}\right\}$ is a solution. A solution $\left\{P_{1}, \ldots, P_{k}\right\}$ is minimal if no $P_{i}$ can be replaced by a shorter $\left(s_{i}, t_{i}\right)$-path $P_{i}^{\prime}$ that uses only vertices of $U_{i}$ in such a way that $P_{1}, \ldots, P_{i-1}, P_{i}^{\prime}, P_{i+1}, \ldots, P_{k}$ are mutually vertex-disjoint. Clearly, every yes-instance of Set-Restricted $k$-Disjoint Paths has a minimal solution. We also observe that any path in a minimal solution is induced. We need Lemma 4, which gives some properties of minimal solutions.

Lemma 4. Let $G$ be a graph with terminal pairs $\left(s_{1}, t_{1}\right), \ldots\left(s_{k}, t_{k}\right)$ and corresponding domains $U_{1}, \ldots, U_{k}$. Let $u \in U_{i}$ for some $1 \leq i \leq k$, and let $\left\{P_{1}, \ldots, P_{k}\right\}$ be a minimal solution with $u \notin \bigcup_{j=1}^{k} V_{P_{j}}$. Then $P_{i}$ has at most two segments inside $N_{G}[u]$. Moreover, if $P_{i}$ has one segment inside $N_{G}[u]$, then $P_{i}$ has at most three vertices. If $P_{i}$ has two segments $Q_{1}$ and $Q_{2}$ inside $N_{G}[u]$, then $Q_{1}$ and $Q_{2}$ each has precisely one vertex, and the segment $Q^{\prime}$ outside $N_{G}[u]$ that lies between $Q_{1}$ and $Q_{2}$ in $P_{i}$ also has one vertex.

Proof. Suppose that $P_{i}$ has three segments $Q_{1}, Q_{2}, Q_{3}$ inside $N_{G}[u]$. Let $x_{j}, y_{j}$ be the end vertices of $Q_{j}$ for $j=1,2,3$. Assume without loss of generality that $x_{1} \prec_{s_{i}} y_{1} \prec_{s_{i}} x_{2} \prec_{s_{i}} y_{2} \prec_{s_{i}} x_{3} \prec_{s_{i}} y_{3}$. Clearly, we can replace the $\left(x_{1}, y_{3}\right)$ subpath of $P_{i}$ of length at least four by $x_{1} u y_{3}$ and obtain a shorter $\left(s_{i}, t_{i}\right)$-path. Hence, $P_{i}$ has at most two segments inside $N_{G}[u]$. Now suppose that a $(x, y)$-path $Q$ is a segment of $P_{i}$ inside $N_{G}[u]$. If $Q$ has at least four vertices, then we replace $Q$ by xuy and obtain a shorter $\left(s_{i}, t_{i}\right)$-path. Finally, suppose that $Q_{1}, Q_{2}$ are segments of $P_{i}$ inside $N_{G}[u]$. Let $x_{j}, y_{j}$ be the end vertices of $Q_{j}$ for $j=1,2$. Let also $Q^{\prime}$ be the segment outside $N_{G}[u]$ that lies between $Q_{1}, Q_{2}$ in $P_{i}$. Assume without loss of generality that $x_{1} \prec_{s_{i}} y_{1} \prec_{s_{i}} x_{2} \prec_{s_{i}} y_{2}$. If one of the paths $Q_{1}, Q_{2}, Q^{\prime}$ has at least two vertices, then we can replace the ( $x_{1}, y_{2}$ )-subpath of $P_{i}$ of length at least three by $x_{1} u y_{2}$ and obtain a shorter $\left(s_{i}, t_{i}\right)$-path.

### 3.2 Dynamic programming for Set-Restricted $\boldsymbol{k}$-Disjoint Paths

We apply dynamic programming to prove that Set-Restricted $k$-Disjoint Paths is polynomial-time solvable on AT-free graphs for every fixed integer $k$. Our algorithm solves the decision problem, but can easily be modified to produce the desired paths if they exist. It is based on the following idea. We find a shortest dominating path $u_{0} \ldots u_{\ell}$ in $G$ as described in Theorem 2. For $0 \leq i \leq \ell$, we trace the segments of $\left(s_{j}, t_{j}\right)$-paths inside $N_{G}\left[\left\{u_{0}, \ldots, u_{i}\right\}\right]$ by extending the segments inside $N_{G}\left[\left\{u_{0}, \ldots, u_{i-1}\right\}\right]$ in $N_{G}\left[u_{i}\right] \backslash N_{G}\left[\left\{u_{0}, \ldots, u_{i-1}\right\}\right]$. Note that if some path is traced from the middle, then we have to extend the corresponding segment in two directions, i.e., we have to trace two paths. The paths inside $N_{G}\left[u_{i}\right] \backslash N_{G}\left[\left\{u_{0}, \ldots, u_{i-1}\right\}\right]$ are constructed recursively, as by Lemmas 3 and 4 we can reduce the number of domains by distinguishing whether $u_{i}$ is used by one of the paths or not. Hence, it is convenient for us to generalize as follows:

Set-Restricted r-Group Disjoint Paths
Instance: A graph $H$, positive integers $p_{1}, \ldots, p_{r}$, terminal pairs $\left(s_{i}^{j}, t_{i}^{j}\right)$ for $i \in\{1, \ldots, r\}$ and $j \in\left\{1, \ldots, p_{i}\right\}$, and domains $U_{1}, \ldots, U_{r}$.
Question: Does $H$ contain mutually vertex-disjoint paths $P_{i}^{j}$, where $i \in$ $\{1, \ldots, r\}$ and $j \in\left\{1, \ldots, p_{i}\right\}$, such that $P_{i}^{j}$ is a path from $s_{i}^{j}$ to $t_{i}^{j}$ using only vertices from $U_{i}$ for $i=1, \ldots, r$ ?

Recall that the domains $U_{1}, \ldots, U_{k}$ are not necessarily pairwise disjoint. Also note that for $p_{1}=\ldots=p_{r}=1$ we have the SET-RESTRICTED $r$-Disjoint Paths problem. We say that for each $1 \leq i \leq r$, the pairs $\left(s_{i}^{1}, t_{i}^{1}\right), \ldots,\left(s_{i}^{p_{i}}, t_{i}^{p_{i}}\right)$ (or corresponding paths) form a group. We are going to solve SET-RESTRICTED $r$-Group Disjoint Paths for induced subgraphs $H$ of $G$ and $r \leq k$ recursively to obtain a solution that can be extended to a solution of Set-Restricted $k$-Disjoint Paths in such a way that $P_{i}^{1}, \ldots, P_{i}^{p_{i}}$ are disjoint subpaths of the $\left(s_{i}, t_{i}\right)$-path $P_{i}$ in the solution of Set-Restricted $k$-Disjoint Paths. Hence, we are interested only in some special solutions of Set-Restricted r-Group Disjoint Paths.

For $r=1$, Set-Restricted $r$-Group Disjoint Paths is the $p_{1}$-Disjoint Paths problem in $H\left[U_{1}\right]$. By the celebrated result of Robertson and Seymour [22], we immediately get the following lemma.

Lemma 5. For $r=1$ and any fixed positive integer $p_{1}$, Set-Restricted $r$ Group Disjoint Paths can be solved in $O\left(n^{3}\right)$ time on $n$-vertex graphs.

Now we are ready to describe our algorithm for Set-Restricted $r$-Group Disjoint Paths. First, we recursively apply the following preprocessing rules.
Rule 1. If $H$ has a vertex $u \notin \cup_{i=1}^{r} U_{i}$, then we delete it and solve the problem on $H-u$.

Rule 2. If there are $i \in\{1, \ldots, r\}$ and $j \in\left\{1, \ldots, p_{i}\right\}$ such that $s_{i}^{j}$ and $t_{i}^{j}$ are in different components of $H\left[U_{i}\right]$, then stop and return No.

Rule 3. If $H$ has components $H_{1}, \ldots, H_{q}$ and $q>1$, then solve the problem for each component $H_{h}$ for the pairs of terminals $\left(s_{i}^{j}, t_{i}^{j}\right)$ such that $s_{i}^{j}, t_{i}^{j} \in V_{H_{h}}$ and the corresponding domains. We return Yes if we get a solution for each component $H_{h}$, and we return No otherwise.

Rule 4. If $r=1$, then solve the problem by Lemma 5.
From now we assume that $r \geq 2$ and $H$ is connected. Let $p=p_{1}+\ldots+p_{r}$.
By Theorem 2, we can find a vertex $u_{0} \in V_{H}$ and a dominating path $P=$ $u_{0} \ldots u_{\ell}$ in $H$ with the property that for $i \in\{1, \ldots, \ell\}, u_{i} \in L_{i}$ and for any $z \in L_{i}, z$ is adjacent to $u_{i-1}$ or $u_{i}$, where $L_{0}, \ldots L_{\ell}$ are the BFS-levels of $u_{0}$. For $i \in\{0, \ldots, \ell\}$, let $W_{i}=N_{H}\left[\left\{u_{0}, \ldots, u_{i}\right\}\right], W_{-1}=\emptyset$, and $S_{i}=N_{G}\left[u_{i}\right] \backslash W_{i-1}$. To simplify notations, we assume that for $i>\ell, S_{i}=\emptyset$, and $S_{-1}=\emptyset$. Note that by the choice of $P$, there are no edges $x y \in E_{H}$ with $x \in S_{j}$ and $y \in$ $N_{H}\left[\left\{u_{0}, \ldots, u_{i}\right\}\right]$ if $j-i>2$.

Our dynamic programming algorithm keeps a table for each $i \in\{0, \ldots, \ell\}$, $X_{i} \subseteq S_{i+1}$ and $Y_{i} \subseteq S_{i+2}$, where $\left|X_{i}\right| \leq 4 p,\left|Y_{i}\right| \leq 4 p$, and an integer next $i_{i} \in$ $\{0, \ldots, r\}$. The table stores information about segments of $\left(s_{j}^{h}, t_{j}^{h}\right)$-paths inside $W_{i}$. Recall that each path can have more than one segment inside $W_{i}$, but in this case by Lemma 1, there are at most three such segments, and by Lemma 2, the number of vertices of the segments outside $W_{i}$, that join the segments inside, is bounded. We keep information about these vertices in $X_{i}, Y_{i}$. If next ${ }_{i}=0$, then no path in the partial solution includes $u_{i+1}$, and if next $t_{i}=j>0$, then only $\left(s_{j}^{h}, \tilde{t}_{j}^{h}\right),\left(\tilde{s}_{j}^{h}, t_{j}^{h}\right),\left(\tilde{s}_{j}^{h}, \tilde{t}_{j}^{h}\right)$-paths can use $u_{i+1}$ (if $i=\ell$, then we assume that $\left.n e x t_{i}=0\right)$. For each $i, X_{i}, Y_{i}, n e x t_{i}$, the table stores a collection of records $\mathcal{R}\left(i, X_{i}, Y_{i}\right.$, next $\left._{i}\right)$ with the elements

$$
\left\{\left(\text { State }_{j}^{h}, R_{j}^{h}\right) \mid 1 \leq j \leq r, 1 \leq h \leq p_{i}\right\}
$$

where $R_{j}^{h}$ are ordered multisets of size at most two without common vertices except (possibly) terminals $s_{1}, \ldots, s_{k}, t_{1}, \ldots, t_{k}$ of the original instance of SETRestricted $k$-Disjoint Paths, $R_{j}^{h} \subseteq U_{j}$, and where each State ${ }_{j}^{h}$ can have one of the following five values:
Not initialized, Started from s, Started from $t$, Started from middle, Completed.

These records correspond to a partial solution of SET-RESTRICTED $r$-Group Disjoint Paths for $H_{i}=H\left[W_{i} \cup X_{i} \cup Y_{i}\right]$ with the following properties.

- If State ${ }_{j}^{h}=$ Not initialized, then $\left(s_{j}^{h}, t_{j}^{h}\right)$-paths have no vertices in $H_{i}$ in the partial solution and $R_{j}^{h}=\emptyset$.
- If State ${ }_{j}^{h}=$ Started from $s$, then $s_{j}^{h} \in W_{i}, t_{j}^{h} \notin V_{H_{i}}$ and $R_{j}^{h}$ contains one vertex. Let $R_{j}=\left(\tilde{t}_{j}^{h}\right)$. Then $\tilde{t}_{j}^{h} \in S_{i-1} \cup S_{i}$ and the partial solution contains an $\left(s_{j}^{h}, \tilde{t}_{j}^{h}\right)$-path.
- If State $j_{j}^{h}=$ Started from $t$, then $s_{j}^{h} \notin V_{H_{i}}, t_{j}^{h} \in W_{i}$ and $R_{j}^{h}$ contains one vertex. Let $R_{j}^{h}=\left(\tilde{s}_{j}^{h}\right)$. Then $\tilde{s}_{j}^{h} \in S_{i-1} \cup S_{i}$ and the partial solution contains an $\left(\tilde{s}_{j}^{h}, t_{j}^{h}\right)$-path.
- If State $j_{j}^{h}=$ Started from middle, then $s_{j}^{h}, t_{j}^{h} \notin V_{H_{i}}$ and $R_{j}^{h}$ contains two vertices. Let $R_{j}^{h}=\left(\tilde{s}_{j}^{h}, \tilde{t}_{j}^{h}\right)$ (it can happen that $\left.\tilde{t}_{j}^{h}=\tilde{s}_{j}^{h}\right)$. Then $\tilde{s}_{j}^{h}, \tilde{t}_{j}^{h} \in$ $S_{i-1} \cup S_{i}$ and the partial solution contains an $\left(\tilde{s}_{j}^{h}, \tilde{t}_{j}^{h}\right)$-path.
- If State ${ }_{j}^{h}=$ Completed, then $s_{j}^{h}, t_{j}^{h} \in W_{i}, R_{j}^{h}=\emptyset$, and it is assumed that the partial solution contains an $\left(s_{j}^{h}, t_{j}^{h}\right)$-path.
We consequently construct the tables for $i=0, \ldots, \ell$. The algorithm returns Yes if $\mathcal{R}\left(\ell, X_{\ell}, Y_{\ell}\right.$, next $\left._{\ell}\right)$ for $X_{\ell}=Y_{\ell}=\emptyset$ contains the record $\left\{\left(\right.\right.$ State $\left._{j}^{h}, R_{j}^{h}\right) \mid 1 \leq$ $\left.j \leq r, 1 \leq h \leq p_{i}\right\}$, where each State ${ }_{j}^{h}=$ (Completed). The tables are constructed and updated as follows.

Constructing the table for $i=0$. First, we guess the collection of terminal pairs $\left(s_{j}^{h}, t_{j}^{h}\right), j \in\{1, \ldots, r\}, h \in\left\{1, \ldots, p_{j}\right\}$, such that the $\left(s_{j}^{h}, t_{j}^{h}\right)$-paths have vertices in $W_{0}=N_{H}\left[u_{0}\right]$. For simplicity, assume that it holds for the pairs $\left(s_{j}^{h}, t_{j}^{h}\right)$, where $j \in\left\{1, \ldots, r^{\prime}\right\}$ and $h \in\left\{1, \ldots, p_{j}^{\prime}\right\}, r^{\prime} \leq r$ and each $p_{j}^{\prime} \leq p_{j}$. For each pair $\left(s_{j}^{h}, t_{j}^{h}\right)$ of this type, we guess the first vertex $\tilde{s}_{j}^{h}$ and the last vertex $\tilde{t}_{j}^{h}$ of the $\left(s_{j}^{h}, t_{j}^{h}\right)$-path in $W_{0}, \hat{s}_{j}^{h} \prec_{s_{j}^{h}} \hat{t}_{j}^{h}$. Note that $\tilde{s}_{j}^{h}=s_{j}^{h}\left(\tilde{t}_{j}^{h}=t_{j}^{h}\right.$ respectively) if $s_{j}^{h} \in W_{0}\left(t_{j}^{h} \in W_{0}\right.$ respectively). For $j \in\left\{1, \ldots, r^{\prime}\right\}, h \in\left\{1, \ldots, p_{j}^{\prime}\right\}$, denote by $P_{j}^{h}$ the corresponding $\left(\tilde{s}_{j}^{h}, \tilde{t}_{j}^{h}\right)$-subpath of the solution.

Clearly, we can assume that these paths are induced. By Lemma $1, P_{j}^{h}$ has at most two segments outside $W_{0}$ and by Lemma 2, each of these segments contains at most two vertices. Then the total number of the segments of paths $P_{j}^{h}$ outside $W_{0}$ is at most $2 p$. Because the vertices of these segments are adjacent to the vertices of $W_{0}$, they are in $S_{1} \cup S_{2}$. We guess the set $X_{0}^{\prime}$ of at most $4 p$ vertices of them in $S_{1}$ and the set $Y_{0}^{\prime}$ of at most $4 p$ vertices of them in $S_{2}$.

Now we do guesses for $u_{0}$. We decide whether $u_{0}$ is included in some $P_{j}^{h}$ or is not included in any of the paths. If $u_{0}$ is a vertex of $P_{j}^{h}$, then by Lemma $3, P_{j}^{h}$ has at most three vertices. Moreover, recall that we are interested in solutions of SETRestricted $r$-Group Disjoint Paths that could be extended to solutions of Set-Restricted $r$-Disjoint Paths and conclude that by Lemma $3, h=1$ and $p_{j}^{\prime}=1$. Otherwise we discard the choice. Then we guess the set of vertices $Z=$ $V_{P_{j}^{h}}$. Suppose now that $u_{0}$ is not included in any $P_{j}^{h}$. Assume that $u_{0} \in U_{j}$. Since we can assume that the final solution of Set-Restricted $r$-Disjoint Paths is minimal, by Lemma 4 we can guess the paths (if any) $P_{j}^{h}$ for $h \in\left\{1, \ldots, p_{i}^{\prime}\right\}$
or discard the choice. Let now $Z$ be the set of the vertices of all such paths ( $Z$ can be empty). Observe that by Lemma $4,|Z| \leq 3$.

Now we are ready to construct $\mathcal{R}\left(0, X_{0}, Y_{0}\right.$, next $\left.t_{0}\right)$ for each of these choices. We include a record $\left\{\left(\right.\right.$ State $\left.\left._{j}^{h}, R_{j}^{h}\right) \mid 1 \leq j \leq r, 1 \leq h \leq p_{i}\right\}$ in $\left.\mathcal{R}\left(0, X_{0}, Y_{0} \text {, next }\right)_{0}\right)$ if the following holds.

- $X_{0}^{\prime} \subseteq X_{0}$ and $Y_{0}^{\prime} \subseteq Y_{0}$.
- For State ${ }_{j}^{h}$ and $R_{j}^{h}$,
- if $s_{j}^{h}, t_{j}^{h} \in W_{0}$, then State ${ }_{j}^{h}=$ Completed, $R_{j}^{h}=\emptyset$;
- if $s_{j}^{h} \in W_{0}, t_{j}^{h} \notin W_{0}$, then State ${ }_{j}^{h}=$ Started from $s, R_{j}^{h}=\left(\tilde{t}_{j}^{h}\right)$;
- if $s_{j}^{h} \notin W_{0}, t_{j}^{h} \in W_{0}$, then State $j_{j}^{h}=$ Started from $t, R_{j}^{h}=\left(\tilde{s}_{j}^{h}\right)$;
- if $s_{j}^{h} \notin W_{0}, t_{j}^{h} \notin W_{0}$ and $j \leq r^{\prime}, h \leq p_{i}^{\prime}$, then State ${ }_{j}^{h}=$ Started from middle, $R_{j}^{h}=\left(\tilde{s}_{j}^{h}, \tilde{t}_{j}^{h}\right) ;$ and
- State $_{j}^{h}=$ Not initialized, $R_{j}^{h}=\emptyset$ otherwise.
- If $n e x t_{0}=0$, then we exclude $u_{1}$ from all domains $U_{j}$, else we exclude $u_{1}$ from domains $U_{j}$ such that next $t_{0} \neq j$. Note that the value of next $t_{0}$ should be consistent with our guesses, i.e., if $u_{1}$ is already chosen to be included in $P_{j}^{h}$, then next $t_{0}=j$. Then we solve Set-Restricted $r^{\prime}$-Group Disjoint Paths for the pairs $\left(\tilde{s}_{j}^{h}, \tilde{t}_{j}^{h}\right)$, where $j \in\left\{1, \ldots, r^{\prime}\right\}$ and $h \in\left\{1, \ldots, p_{j}^{\prime}\right\}$ for $H\left[W_{0} \cup X_{0}^{\prime} \cup Y_{0}^{\prime}\right]$. Observe that by the choice of $Z$, we already guessed the paths from one group. Hence, it remains to find the paths $P_{j}^{h}$ from at most $r-1$ groups, and we do it by calling our algorithm recursively for $H\left[W_{0} \cup X_{0}^{\prime} \cup y_{0}^{\prime}\right]-Z$ and the corresponding terminal pairs. We include the record in $\mathcal{R}\left(0, X_{0}, Y_{0}\right.$, next $\left._{0}\right)$ if we get a Yes-answer.

Constructing the table for $i>0$. We assume that $\underset{\tilde{\mathcal{S}}}{\mathcal{R}}\left(i-1, X_{i-1}, Y_{i-1}\right.$, next $\left._{i-1}\right)$ is already constructed. We consider each element $\left\{\left(\tilde{S} t a t e e_{j}^{h}, \tilde{R}_{j}^{h}\right) \mid 1 \leq j \leq r, 1 \leq\right.$ $\left.h \leq p_{i}\right\}$ of $\mathcal{R}\left(i-1, X_{i-1}, Y_{i-1}\right.$, next $\left._{i-1}\right)$ and we then construct their successors in $\mathcal{R}\left(i, X_{i}, Y_{i}\right.$, next $\left._{i}\right)$.

First, we guess the collection of terminal pairs $\left(s_{j}^{h}, t_{j}^{h}\right), j \in\{1, \ldots, r\}, h \in$ $\left\{1, \ldots, p_{j}\right\}$, such that the $\left(s_{j}^{h}, t_{j}^{h}\right)$-paths have vertices in $S_{i}$. For simplicity, assume that it holds for the pairs $\left(s_{j}^{h}, t_{j}^{h}\right)$, where $j \in\left\{1, \ldots, r^{\prime}\right\}$ and $h \in\left\{1, \ldots, p_{j}^{\prime}\right\}, r^{\prime} \leq$ $r$ and each $p_{j}^{\prime} \leq p_{j}$. Suppose also that for $j \in\left\{1, \ldots, r^{\prime \prime}\right\}$ and $h \in\left\{1, \ldots, p_{j}^{\prime \prime}\right\}$, where $r^{\prime \prime} \leq r^{\prime}$ and each $p_{j}^{\prime \prime} \leq p_{j}^{\prime}$, the $\left(s_{j}^{h}, t_{j}^{h}\right)$-paths have no vertices in $W_{i-1}$, i.e., $\tilde{S}$ tate ${ }_{j}^{h}=$ Not initialized.

For $j \in\left\{1, \ldots, r^{\prime \prime}\right\}$ and $h \in\left\{1, \ldots, p_{j}^{\prime \prime}\right\}$, we guess the first vertex $\hat{s}_{j}^{h}$ and the last vertex $\hat{t}_{j}^{h}$ of the $\left(s_{j}^{h}, t_{j}^{h}\right)$-path in $S_{i} \backslash\left(X_{i-1} \cup Y_{i-2}\right), \hat{s}_{j}^{h} \prec_{s_{j}^{h}} \hat{t}_{j}^{h}$, (it is assumed that $\left.Y_{-1}=\emptyset\right)$. Recall here that the vertices of $X_{i-1} \cup Y_{i-2}$ are already assumed to be included in paths that have vertices in $W_{i-1}$. Note that $\hat{s}_{j}^{h}=s_{j}^{h}$ $\left(\hat{t}_{j}^{h}=t_{j}^{h}\right.$ respectively) if $s_{j}^{h} \in S_{i}\left(t_{j}^{h} \in S_{i}\right.$ respectively). For $j \in\left\{1, \ldots, r^{\prime \prime}\right\}$, $h \in\left\{1, \ldots, p_{j}^{\prime \prime}\right\}$, denote by $P_{j}^{h}$ the corresponding $\left(\hat{s}_{j}^{h}, \hat{t}_{j}^{h}\right)$-subpath of the solution. Clearly, we can assume that these paths are induced. By Lemma $1, P_{j}^{h}$ has at most two segments outside $S_{i}$ and by Lemma 2, each of these segments contains at most two vertices. Then by Lemma 1 , the total number of the segments of
paths $P_{j}^{h}$ outside $S_{i}$ is at most $2 p^{\prime \prime}$, where $p^{\prime \prime}=p_{1}^{\prime \prime}+\ldots+p_{r^{\prime \prime}}^{\prime \prime}$. Because the vertices of these segments are adjacent to the vertices of $S_{i}$, they are in $S_{i+1} \cup S_{i+2}$. We guess the set $X_{i}^{\prime}$ with at most $4 p^{\prime \prime}$ vertices of them in $S_{i+1} \backslash Y_{i-1}$ and the set $Y_{i}^{\prime}$ with at most $4 p^{\prime \prime}$ vertices of them in $S_{i+2}$.

Consider now $j \in\left\{r^{\prime \prime}+1, \ldots, r^{\prime}\right\}$ and $h \in\left\{p_{j}^{\prime \prime}+1, \ldots, p_{j}^{\prime}\right\}$. We have the following cases.

Case 1. State $e_{j}^{h}=$ Started from $s$. Then $s_{j}^{h} \in W_{i-1}$ and the partial solution in $\mathcal{R}\left(i-1, X_{i-1}, Y_{i-1}\right.$, next $\left._{i-1}\right)$ contains a $\left(s_{j}^{h}, \tilde{t}_{j}^{h}\right)$-path. Recall that $\tilde{R}_{j}^{h}=\left(\tilde{t}_{j}^{h}\right)$. We guess the first vertex $\hat{s}_{j}^{h}$ and the last vertex $\hat{t}_{j}^{h}$ of the $\left(s_{j}^{h}, t_{j}^{h}\right)$-path in $S_{i} \backslash\left(X_{i-1} \cup\right.$ $\left.Y_{i-2}\right), \hat{s}_{j}^{h} \prec_{s_{j}^{h}} \hat{t}_{j}^{h}$, where $\hat{s}_{j}^{h}$ is adjacent to $\tilde{t}_{j}^{h}$. Note that $\hat{t}_{j}^{h}=t_{j}^{h}$ if $t_{j}^{h} \in S_{i}$. Denote by $P_{j}^{h}$ the corresponding $\left(\hat{s}_{j}^{h}, \hat{t}_{j}^{h}\right)$-subpath of the solution. We say that $P_{j}^{h}$ is obtained by the extension from $\left(\tilde{t}_{j}^{h}\right)$.
Case 2. State ${ }_{j}^{h}=$ Started from $t$. Then $t_{j}^{h} \in W_{i-1}$ and the partial solution in $\mathcal{R}\left(i-1, X_{i-1}, Y_{i-1}, n e x t_{i-1}\right)$ contains a $\left(\tilde{s}_{j}^{h}, t_{j}^{h}\right)$-path. Recall that $\tilde{R}_{j}^{h}=\left(\tilde{s}_{j}^{h}\right)$. We guess the first vertex $\hat{s}_{j}^{h}$ and the last vertex $\hat{t}_{j}^{h}$ of the $\left(s_{j}^{h}, t_{j}^{h}\right)$-path in $S_{i} \backslash\left(X_{i-1} \cup\right.$ $\left.Y_{i-2}\right), \hat{s}_{j}^{h} \prec_{s_{j}^{h}} \hat{t}_{j}^{h}$, where $\hat{t}_{j}^{h}$ is adjacent to $\tilde{s}_{j}^{h}$. Note that $\hat{s}_{j}^{h}=s_{j}^{h}$ if $s_{j}^{h} \in S_{i}$. Denote by $P_{j}^{h}$ the corresponding $\left(\hat{s}_{j}^{h}, \hat{t}_{j}^{h}\right)$-subpath of the solution. We say that $P_{j}^{h}$ is obtained by the extension from $\left(\tilde{s}_{j}^{h}\right)$.
Case 3. State ${ }_{j}^{h}=$ Started from middle. Then $s_{j}^{h}, t_{j}^{h} \notin W_{i-1}$ and the partial solution in $\mathcal{R}\left(i-1, X_{i-1}, Y_{i-1}\right.$, next $\left._{i-1}\right)$ contains a $\left(\tilde{s}_{j}^{h}, \tilde{t}_{j}^{h}\right)$-path. Recall that $\tilde{R}_{j}^{h}=\left(\tilde{s}_{j}^{h}, \tilde{t}_{j}^{h}\right)$ in this case. We have three possibilities to extend this path.
Case 3.1. We guess the first vertex $\hat{s}_{j}^{h}$ and the last vertex $\hat{t}_{j}^{h}$ of the $\left(s_{j}^{h}, t_{j}^{h}\right)$-path in $S_{i} \backslash\left(X_{i-1} \cup Y_{i-2}\right), \hat{s}_{j}^{h} \prec_{s_{j}^{h}} \hat{t}_{j}^{h}$, where $\tilde{t}_{j}^{h} \prec_{s_{j}^{h}} \hat{s}_{j}^{h}$ and $\tilde{t}_{j}^{h}$ is adjacent to $\hat{s}_{j}^{h}$. Denote by $P_{j}^{h}$ the corresponding $\left(\hat{s}_{j}^{h}, \hat{t}_{j}^{h}\right)$-subpath of the solution. We say that $P_{j}^{h}$ is obtained by the extension from $\left(\tilde{t}_{j}^{h}\right)$. Note that $\hat{t}_{j}^{h}=t_{j}^{h}$ if $t_{j}^{h} \in S_{i}$.
Case 3.2. We guess the first vertex $\hat{s}_{j}^{h}$ and the last vertex $\hat{t}_{j}^{h}$ of the $\left(s_{j}^{h}, t_{j}^{h}\right)$-path in $S_{i} \backslash\left(X_{i-1} \cup Y_{i-2}\right), \hat{s}_{j}^{h} \prec_{s_{j}^{h}} \hat{t}_{j}^{h}$, where $\hat{t}_{j}^{h} \prec_{s_{j}^{h}} \tilde{s}_{j}^{h}$ and $\hat{t}_{j}^{h}$ is adjacent to $\tilde{s}_{j}^{h}$. Denote by $P_{j}^{h}$ the corresponding $\left(\hat{s}_{j}^{h}, \hat{t}_{j}^{h}\right)$-subpath of the solution. We say that $P_{j}^{h}$ is obtained by the extension from $\left(\tilde{s}_{j}^{h}\right)$. Note that $\hat{s}_{j}^{h}=s_{j}^{h}$ if $s_{j}^{h} \in S_{i}$.

Case 3.3. We guess the first vertex $\hat{s}_{j}^{h(1)}$ and the last vertex $\hat{t}_{j}^{h(1)}$ of the $\left(s_{j}^{h}, t_{j}^{h}\right)$ path in $S_{i} \backslash\left(X_{i-1} \cup Y_{i-2}\right), \hat{s}_{j}^{h(1)} \prec_{s_{j}^{h}} \hat{t}_{j}^{h(1)}$, where $\hat{t}_{j}^{h(1)}$ is adjacent to $\tilde{s}_{j}^{h}$. Then we guess the first vertex $\hat{s}_{j}^{h(2)}$ and the last vertex $\hat{t}_{j}^{h(2)}$ of the $\left(s_{j}^{h}, t_{j}^{h}\right)$-path in $S_{i} \backslash\left(X_{i-1} \cup Y_{i-2}\right), \hat{s}_{j}^{h(2)} \prec_{s_{j}^{h}} \hat{t}_{j}^{h(2)}$, where $\hat{s}_{j}^{h(2)}$ is adjacent to $\tilde{t}_{j}^{h}$. Note that $\hat{s}_{j}^{h(1)}=$ $s_{j}^{h}$ if $s_{j}^{h} \in S_{i}$ and $\hat{t}_{j}^{h(2)}=t_{j}^{h}$ if $t_{j}^{h} \in S_{i}$. Denote by $P_{j}^{h(1)}, P_{j}^{h(2)}$ the corresponding $\left(\hat{s}_{j}^{h(1)}, \hat{t}_{j}^{h(1)}\right)$ and $\left(\hat{s}_{j}^{h(2)}, \hat{t}_{j}^{h(2)}\right)$-subpath of the solution respectively. We say that $P_{j}^{h(1)}, P_{j}^{h(2)}$ are obtained by the extension from $\left(\tilde{s}_{j}^{h}\right)$ and $\left(\tilde{t}_{j}^{h}\right)$ respectively.

Clearly, we can assume that all the paths $P_{j}^{h}, P_{j}^{h(1)}, P_{j}^{h(2)}$ are induced. By Lemma 1, each path has at most two segments outside $S_{i}$ and by Lemma 2, each of these segments contains at most two vertices. Then the total number of segments of the paths $P_{j}^{h}, P_{j}^{h(1)}, P_{j}^{h(2)}$ outside $S_{i}$ is at most $2\left(p^{\prime}-p^{\prime \prime}\right)$, where $p^{\prime}=P_{1}^{\prime}+\ldots+p_{r^{\prime}}^{\prime}$. Because the vertices of these segments are adjacent to the vertices of $S_{i}$, they are in $S_{i+1} \cup S_{i+2}$. We guess the set $X_{i}^{\prime \prime}$ of at most $4\left(p^{\prime}-p^{\prime \prime}\right)$ vertices of them in $S_{i+1} \backslash\left(Y_{i-1} \cup X_{i}^{\prime}\right)$ and the set $Y_{i}^{\prime \prime}$ of at most $2\left(p^{\prime}-p^{\prime \prime}\right)$ their vertices in $S_{i+2} \backslash Y_{i}^{\prime}$.

Observe additionally that again by Lemma 1, it should hold that $\mid Y_{i-1} \cup X_{i}^{\prime} \cup$ $X_{i}^{\prime \prime} \mid \leq 4 p$; otherwise we discard our current choice.

Now we consider $u_{i}$. We have two cases.
Case 1. next $t_{-1}=0$. Then $u_{i}$ is not included in any path in the partial solution. Assume that $u_{0} \in U_{j}$. Since we can assume that the final solution of SETRestricted $r$-Disjoint Paths is minimal, by Lemma 4 we can guess the paths (if any) $P_{j}^{h}, P_{j}^{h(1)}, P_{j}^{h(2)}$ for $h \in\left\{1, \ldots, p_{i}^{\prime}\right\}$ or discard the choice. Let now $Z$ be the set of the vertices of all such paths ( $Z$ can be empty). Observe that by Lemma $4,|Z| \leq 3$.

Case 2. next ${ }_{i-1}=j>0$. By Lemma 3, $P_{j}^{h}\left(\right.$ or $P_{j}^{h(1)}$ or $\left.P_{j}^{h(2)}\right)$ has at most three vertices. Moreover, we again recall that we are interested in solutions of SETRestricted $r$-Group Disjoint Paths that could be extended to solutions of Set-Restricted $r$-Disjoint Paths and conclude by Lemma 3, that we should have at most one path for $j$; otherwise we discard the choice. Then we guess the set of vertices $Z$ of this path.

Now we are ready to construct $\mathcal{R}\left(i, X_{i}, Y_{i}\right.$, next $\left._{i}\right)$ for each of these choices. Recall that the pairs $\left(\tilde{S} t a t e e_{j}^{h}, \tilde{R}_{j}^{h}\right)$ are elements of $\mathcal{R}\left(i-1, X_{i-1}, Y_{i-1}\right.$, next $\left._{i-1}\right)$. We include a record $\left\{\left(\right.\right.$ State $\left.\left._{j}^{h}, R_{j}^{h}\right) \mid 1 \leq j \leq r, 1 \leq h \leq p_{i}\right\}$ in $\mathcal{R}\left(i, X_{i}, Y_{i}\right.$, next $\left._{i}\right)$ if the following holds.

- If $\tilde{S}$ tate ${ }_{j}^{h}=$ Completed, then State $e_{j}^{h}=$ Completed, $R_{j}^{h}=\emptyset$.
- If $\underset{\tilde{S}}{ }$ tate ${ }_{j}^{h}=$ Not initialized and $j>r^{\prime}$, then State ${ }_{j}^{h}=$ Not initialized, $R_{j}^{h}=\emptyset$.
- If $\tilde{S t a t e} e_{j}^{h}=$ Started from $s$ or Started from $t$ or Started from middle and $z \in \tilde{R}_{j}^{h} \cap S_{i-2}$, then $r^{\prime \prime}+1 \leq j \leq r^{\prime}$ and the path obtained by extension from $z$ is added.
- If $\tilde{S}$ tate $e_{j}^{h}=$ Started from $s$ and $\tilde{R}_{j}^{h}=\left(\tilde{t}_{j}^{h}\right)$, then
- if $j>r^{\prime}$, then State ${ }_{j}^{h}=$ Started from $s, R_{j}^{h}=\left(\tilde{t}_{j}^{h}\right)$;
- if $r^{\prime \prime}+1 \leq j \leq r^{\prime}$, then if $t_{j}^{h} \in S_{i}$, then State $h_{j}^{h}=$ Completed, $R_{j}^{h}=\emptyset$; else if $t_{j}^{h} \notin S_{i}$, then State ${ }_{j}^{h}=$ Started from $s, R_{j}^{h}=\left(\hat{t}_{j}^{h}\right)$.
- If $\tilde{S t a t e} e_{j}^{h}=$ Started from $t$ and $\tilde{R}_{j}^{h}=\left(\tilde{s}_{j}^{h}\right)$, then
- if $j>r^{\prime}$, then State ${ }_{j}^{h}=$ Started from $t, R_{j}^{h}=\left(\tilde{s}_{j}^{h}\right)$;
- if $r^{\prime \prime}+1 \leq j \leq r^{\prime}$, then if $s_{j}^{h} \in S_{i}$, then State ${ }_{j}^{h}=$ Completed, $R_{j}^{h}=\emptyset$; else if $s_{j}^{h} \notin S_{i}$, then State ${ }_{j}^{h}=$ Started from $s, R_{j}^{h}=\left(\hat{s}_{j}^{h}\right)$.
- If $\tilde{S}$ tate ${ }_{j}^{h}=$ Started from middle and $\tilde{R}_{j}^{h}=\left(\tilde{s}_{j}^{h}, \tilde{t}_{j}^{h}\right)$, then
- if $j>r^{\prime}$, then State $e_{j}^{h}=$ Started from middle, $R_{j}^{h}=\left(\tilde{s}_{j}^{h}, \tilde{t}_{j}^{h}\right)$;
- if $r^{\prime \prime}+1 \leq j \leq r^{\prime}$ and only the path obtained by the extension from $\tilde{t}_{j}^{h}$ is included in the partial solution by our guesses, then if $t_{j}^{h} \in S_{i}$, then State ${ }_{j}^{h}=$ Started from $s, R_{j}^{h}=\left(\tilde{s}_{j}^{h}\right)$; else if $t_{j}^{h} \notin S_{i}$, then State ${ }_{j}^{h}=$ Started from middle, $R_{j}^{h}=\left(\tilde{s}_{j}^{h}, \hat{t}_{j}^{h}\right)$;
- if $r^{\prime \prime}+1 \leq j \leq r^{\prime}$ and only the path obtained by the extension from $\tilde{s}_{j}^{h}$ is included in the partial solution by our guesses, then if $s_{j}^{h} \in S_{i}$, then State ${ }_{j}^{h}=$ Started from $t, R_{j}^{h}=\left(\tilde{t}_{j}^{h}\right)$; else if $s_{j}^{h} \notin S_{i}$, then State ${ }_{j}^{h}=$ Started from middle, $R_{j}^{h}=\left(\hat{s}_{j}^{h}, \tilde{t}_{j}^{h}\right)$;
- if $r^{\prime \prime}+1 \leq j \leq r^{\prime}$ and two path obtained by the extension from $\tilde{s}_{j}^{h}$ and $\tilde{t}_{j}^{h}$ are included in the partial solution by our guesses, then if $s_{j}^{h}, t_{j}^{h} \in$ $S_{i}$, then State $e_{j}^{h}=$ Completed, $R_{j}^{h}=\emptyset$; else if $s_{j}^{h} \in S_{i}, t_{j}^{h} \notin S_{i}$, then State ${ }_{j}^{h}=$ Started from $s, R_{j}^{h}=\left(\hat{t}_{j}^{h(2)}\right)$; else if $s_{j}^{h} \notin S_{i}, t_{j}^{h} \in S_{i}$, then State ${ }_{j}^{h}=$ Started from $t, R_{j}^{h}=\left(\hat{s}_{j}^{h(1)}\right)$; else if $s_{j}^{h}, t_{j}^{h} \notin S_{i}$, then State ${ }_{j}^{h}=$ Started from middle, $R_{j}^{h}=\left(\hat{s}_{j}^{h(1)}, \hat{s}_{j}^{h(2)}\right)$.
- For $j \leq r^{\prime \prime}$,
- if $s_{j}^{h}, t_{j}^{h} \in S_{i}$, then State ${ }_{j}^{h}=$ Completed, $R_{j}^{h}=\emptyset$;
- if $s_{j}^{h} \in S_{i}, t_{j}^{h} \notin S_{i}$, then State $e_{j}^{h}=$ Started from $s, R_{j}^{h}=\left(\hat{t}_{j}^{h}\right)$;
- if $s_{j}^{h} \notin S_{i}, t_{j}^{h} \in S_{i}$, then State $j_{j}^{h}=$ Started from $t, R_{j}^{h}=\left(\hat{s}_{j}^{h}\right)$;
- if $s_{j}^{h} \notin S_{i}, t_{j}^{h} \notin S_{i}$ and $j \leq r^{\prime}, h \leq p_{i}^{\prime}$, then State ${ }_{j}^{h}=$ Started from middle, $R_{j}^{h}=\left(\hat{s}_{j}^{h}, \hat{t}_{j}^{h}\right) ;$ and
- State $_{j}^{h}=$ Not initialized, $R_{j}^{h}=\emptyset$ otherwise.
$-X_{i}^{\prime} \cup X_{i}^{\prime \prime} \cup Y_{i} \subseteq X_{i}$ and $Y_{i}^{\prime} \cup Y_{i}^{\prime \prime} \subseteq Y_{i}$.
- If next ${ }_{i}=0$, then we exclude $u_{i+1}$ from all domains $U_{j}$, else we exclude $u_{i+1}$ from domains $U_{j}$ such that next $i_{i} \neq j$. Note that the value of $n e x t_{i}$ should be consistent with our guesses, i.e., if $u_{i+1}$ is already chosen to be included in $P_{j}^{h}$, then next ${ }_{0}=j$. Then we solve Set-Restricted $r^{\prime}$-Group Disjoint Paths for the pairs $\left(\hat{s}_{j}^{h}, \hat{t}_{j}^{h}\right),\left(\hat{s}_{j}^{h(1)}, \hat{t}_{j}^{h(1)}\right)$ and $\left(\hat{s}_{j}^{h(2)}, \hat{t}_{j}^{h(2)}\right)$ obtained by our guesses, where $j \in\left\{1, \ldots, r^{\prime}\right\}$ and $h \in\left\{1, \ldots, p_{j}^{\prime}\right\}$ for $H^{\prime}=H\left[S_{i} \backslash\left(X_{i-1} \cup\right.\right.$ $\left.\left.Y_{i-2}\right) \cup X_{i}^{\prime} \cup X_{i}^{\prime \prime} \cup Y_{i}^{\prime} \cup Y_{i}^{\prime \prime}\right]$. Observe that by the choice of $Z$, we already guessed the paths from one group. Hence, it remains to find the paths from at most $r-1$ groups, and we do it by calling our algorithm recursively for $H^{\prime}-Z$ and the corresponding terminal pairs. We include the record in $\mathcal{R}\left(i, X_{i}, Y_{i}\right.$, next $\left._{i}\right)$ if we get a Yes-answer.

Now we are ready to prove our main theorem.
Theorem 3. Set-Restricted $k$-Disjoint Paths can be solved in $O\left(n^{f(k)}\right)$ time for n-vertex AT-free graphs for some function $f(k)$ that only depends on $k$.

Proof. We apply the algorithm for Set-Restricted $k$-Group Disjoint Paths described above for $G, p_{1}=\ldots=p_{k}=1$, terminal pairs $\left(s_{j}^{1}, t_{j}^{1}\right)=\left(s_{j}, t_{j}\right)$, and domains $U_{1}, \ldots, U_{k}$.

Correctness of the algorithm follows from its construction. It is sufficient to observe that if the Yes-answer was given by the algorithm then we have our disjoint paths. From another side, if a given instance of Set-Restricted $k$-Disjoint Paths has a solution, then we can assume that this solution is minimal, and in each step of the algorithm we can always make guesses that correspond to these paths. Clearly, these choices would lead us to a Yes-answer.

It remains to prove that the algorithm runs in polynomial time for any fixed $k$. To produce each $\mathcal{R}\left(i, X_{i}, Y_{i}\right.$, next $\left._{i}\right)$, we guess some vertices. The total number of guesses is at most $O\left(p_{1}+\ldots+p_{r}\right)$. Note that initially $r=k$ and $p_{1}=\ldots=p_{k}=1$. We call our algorithm recursively and for each recursive call, we reduce the number of groups and we can multiply the number of pairs in a group by at most two. Hence, $p_{1}+\ldots+p_{r} \leq k 2^{k-1}$. If $r=1$, then we solve the problem using Lemma 5 in time $g\left(k 2^{k-1}\right) n^{3}$ for some function $g(k)$ not depending on $n$. Then the running time of our algorithm is $O\left(n^{f(k)}\right)$ for some function $f(k)$ not depending on $n$.

### 3.3 Set-restricted $k$-Disjoint Connected Subgraphs

We show that our algorithm for Set-Restricted k-Disjoint Paths can be applied to solve the more general problem Set-REStricted $k$-Disjoint Connected Subgraphs on AT-free graphs.

Theorem 4. Set-Restricted $k$-Disjoint Connected Subgraphs can be solved in polynomial time on AT-free graphs for any fixed integer $k$.

Proof. Clearly, we can assume that for $i \in\{1, \ldots, k\}, S_{i} \subseteq U_{i}$, and for any $j \in\{1, \ldots, k\}, j \neq i, S_{i} \cap U_{j}=\emptyset$.

Observe that if $G$ contain $k$ pairwise vertex-disjoint connected subgraphs $G_{1}, \ldots, G_{k}$ such that $S_{i} \subseteq V_{G_{i}} \subseteq U_{i}$, for $1 \leq i \leq k$, then each $G_{i}$ is AT-free and, therefore, has a dominating pair $\left(u_{i}, v_{i}\right)$ by Theorem 1 . For each $i \in\{1, \ldots, k\}$, we guess this pair $\left(u_{i}, v_{i}\right)$ (it can happen that $\left.u_{i}=v_{i}\right)$, and guess at most six vertices of a shortest $\left(u_{i}, v_{i}\right)$-path $P_{i}$ in $G_{i}$ as follows: if $P_{i}$ has at most five vertices, then we guess all vertices of $P_{i}$, and if $P_{i}$ has at least six vertices, then we guess the first three vertices $x_{1}^{i}, x_{2}^{i}, x_{s}^{i} \in U_{i}$ and the last three vertices $y_{1}^{i}, y_{2}^{i}, y_{3}^{i} \in U_{i}, u_{i}=x_{1}^{i}, v_{i}=y_{3}^{i}$ and $x_{1}^{i} \prec_{u_{i}} x_{2}^{i} \prec_{u_{i}} x_{3}^{i} \prec_{u_{i}} y_{1}^{i} \prec_{u_{i}} y_{2}^{i} \prec_{u_{i}} y_{3}^{i}$ in $P_{i}$. Observe that $P_{i}$ is an induced path.

If we guess all vertices of $P_{i}$, then we check whether $P_{i}$ dominates $S_{i}$, and if it is so, then we solve Set-Restricted Disjoint Connected Subgraphs for the graph $G-\left(V_{P_{i}} \cup S_{i}\right)$ and the sets $S_{j}, j \neq i$ with their domains. Otherwise we discard our choice.

Now we can assume that for each $i \in\{1, \ldots, k\}, P_{i}$ has at least six vertices. We modify domains $U_{i}$ and sets $S_{i}: U_{i}^{\prime}=\left(U_{i} \backslash N_{G}\left[\left\{x_{i}^{1}, x_{i}^{2}, y_{i}^{2}, y_{i}^{3}\right\}\right]\right) \cup$ $\left\{x_{i}^{1}, x_{i}^{2}, x_{i}^{3}, y_{1}^{1}, y_{i}^{2}, y_{i}^{3}\right\}$ and $S_{i}^{\prime}=U_{i} \backslash N_{G}\left[\left\{x_{i}^{1}, x_{i}^{2}, y_{i}^{2}, y_{i}^{3}\right\}\right]$ for $i \in\{1, \ldots, k\}$. The vertices of $S_{i}^{\prime}$ should be in the same component of $G\left[U_{i}^{\prime}\right]$; otherwise we discard our guess, since $P_{i}$ should dominate $S_{i}$. Denote by $U_{i}^{\prime \prime}$ the set of vertices of the component of $G\left[U_{i}^{\prime}\right]$ with $S_{i} \subseteq U_{i}^{\prime \prime}$.

We claim that $\left(x_{1}^{i}, y_{3}^{i}\right)$ is a dominating pair in $G\left[U_{i}^{\prime \prime}\right]$ for $i \in\{1, \ldots, k\}$. To show it, consider a dominating pair $(x, y)$ in $G\left[U_{i}^{\prime \prime}\right]$. Any $(x, y)$-path $P$ dominates $x_{1}^{i}$ and $y_{3}^{i}$. It follows that one vertex of the pair is in $\left\{x_{1}^{i}, x_{2}^{i}\right\}$ and another is in $\left\{y_{2}^{i}, y_{3}^{i}\right\}$. It remains to observe that if $x_{2}^{i}$ ( $y_{2}^{i}$ respectively) is in the pair, then it can be replaced by $x_{1}^{i}$ ( $y_{3}^{i}$ respectively).

It follows that any $\left(x_{1}^{i}, y_{3}^{i}\right)$-path in dominates $G\left[U_{i}^{\prime \prime}\right]$. We can find disjoint $\left(x_{1}^{i}, y_{3}^{i}\right)$-paths (if exist), by solving Set-Restricted $k$-Disjoint Paths for the pairs of terminals $\left(x_{1}^{i}, y_{3}^{i}\right)$ with domains $U_{i}^{\prime \prime}$ for $i \in\{1, \ldots, k\}$. Since by Theorem 3, it can be done in polynomial time, and we guess at most $6 k$ vertices, the claim of the theorem follows.

## 4 Induced Minors

In this section we consider the $H$-Induced Minor problem. It is convenient for us to represent this problem in the following way. An $H$-witness structure of $G$ is a collection of $\left|V_{H}\right|$ non-empty mutually disjoint sets $W(x) \subseteq V_{G}$, one set for each $x \in V_{H}$, called $H$-witness sets, such that
(i) each $W(x)$ is a connected set; and
(ii) for all $x, y \in V_{H}$ with $x \neq y$, sets $W(x)$ and $W(y)$ are adjacent in $G$ if and only if $x$ and $y$ are adjacent in $H$.

Observe that $H$ is an induced minor of $G$ if and only if $G$ has an $H$-witness structure.

Theorem 5. H-Induced Minor can be solved in polynomial time on AT-free graphs for any fixed graph $H$.

Proof. Suppose that $H$ is an induced minor of $G$. Then $G$ has an $H$-witness structure, i.e., sets $W(x) \subseteq V_{G}$ for $x \in V_{H}$. For each $x \in V_{H}, G[W(x)]$ is a connected AT-free graph. Hence, by Theorem $1, G[W(x)]$ has a dominating pair $\left(u_{x}, v_{x}\right)$.

For each $x \in V_{H}$, we guess the pair $\left(u_{x}, v_{x}\right)$ (it can happen that $u_{x}=v_{x}$ ), and guess at most six vertices of a shortest $\left(u_{x}, v_{x}\right)$-path $P_{x}$ in $G[W(x)]$ as follows: if $P_{x}$ has at most five vertices, then we guess all vertices of $P_{x}$, and if $P_{x}$ has at least six vertices, then we guess the first three vertices $u_{1}^{x}, u_{2}^{x}, u_{3}^{x}$ and the last three vertices $v_{1}^{x}, v_{2}^{x}, v_{3}^{x}$ such that $u_{x}=u_{1}^{x}, v_{x}=v_{3}^{x}$ and $u_{1}^{x} \prec_{u_{x}} u_{2}^{x} \prec_{u_{x}} u_{3}^{x} \prec_{u_{x}}$ $v_{1}^{x} \prec_{u_{x}} v_{2}^{x} \prec_{u_{x}} v_{3}^{x}$ in $P_{x}$. Observe that $P_{x}$ is an induced path. We denote by $X_{1}, X_{2}$ the partition of $V_{H}$ (one of the sets can be empty), where for $x \in X_{1}$, all at most five vertices of $P_{x}$ were chosen, and for $x \in X_{2}$, we have the vertices $u_{1}^{x}, u_{2}^{x}, u_{3}^{x}, v_{1}^{x}, v_{2}^{x}, v_{3}^{x}$. Further, for each edge $x y \in E_{H}$, we guess adjacent vertices $s_{x y}, s_{y x} \in V_{G}$, where $s_{x y} \in W(x)$ and $s_{y x} \in W(y)$. Note that the vertices $s_{x y}$ are not necessarily distinct, and some of them can coincide with the vertices chosen to represent $P_{x}$. Let $S(x)=\left\{s_{x y} \mid x y \in E_{H}\right\}$. All the guesses should be consistent with the witness structure, i.e., vertices included in distinct $W(x)$ should be distinct, and if $x y \notin E_{H}$, then the vertices included in $W(x)$ and $W(y)$ should be non-adjacent in $G$.

For $x \in X_{1}$, we check whether the guessed path $P_{x}$ dominates $S(x)$, and if it is so, then we let $W^{\prime}(x)=V_{P_{x}} \cup S(x)$. Otherwise we discard our choice.

Recall that we already selected some vertices, and that we cannot use these vertices and also not their neighbors in case non-adjacencies in $H$ forbid this. Hence, for each $x \in X_{2}$, we obtain the set

$$
\begin{aligned}
U_{x} & =V_{G} \backslash\left(\left(\cup_{y \in X_{1}, x y \in E_{H}} W^{\prime}(y)\right) \cup\left(\cup_{y \in X_{1}, x y \notin E_{H}} N_{G}\left[W^{\prime}(y)\right]\right) \cup\right. \\
& \cup\left(\cup_{y \in X_{2}, x y \in E_{H}}\left(S(y) \cup\left\{u_{1}^{y}, u_{2}^{y}, u_{3}^{y}, v_{1}^{y}, v_{2}^{y}, v_{3}^{y}\right\}\right) \cup\right. \\
& \cup\left(\cup_{y \in X_{2} \backslash\{x\}, x y \notin E_{H} N_{G}\left[S(y) \cup\left\{u_{1}^{y}, u_{2}^{y}, u_{3}^{y}, v_{1}^{y}, v_{2}^{y}, v_{3}^{y}\right\}\right] \cup}\right. \\
& \left.\cup N_{G}\left[\left\{u_{1}^{x}, u_{2}^{x}, v_{2}^{x}, v_{3}^{x}\right\}\right]\right) \cup\left\{u_{1}^{x}, u_{2}^{x}, u_{3}^{x}, v_{1}^{x}, v_{2}^{x}, v_{3}^{x}\right\} .
\end{aligned}
$$

Then for each $x \in X_{2}$, we check whether $S^{\prime}(x)=S(x) \backslash N_{G}\left[\left\{u_{1}^{x}, u_{2}^{x}, v_{2}^{x}, v_{3}^{x}\right\}\right]$ is included in one component of $G\left[U_{x}\right]$. If it is not so, then we discard our choice, since we cannot have a path with the first vertices $u_{1}^{x}, u_{2}^{x}, u_{3}^{x}$ and the last vertices $v_{1}^{x}, v_{2}^{x}, v_{3}^{x}$ that dominates $S(x)$. Otherwise we denote by $U_{x}^{\prime}$ the set of vertices of the component of $G\left[U_{x}\right]$ that contains $S^{\prime}(x)$. Note that $\left(u_{1}^{x}, v_{3}^{x}\right)$ is a dominating pair in $G\left[U_{x}^{\prime}\right]$ for $x \in X_{2}$. To show it, consider a dominating pair $(u, v)$ in $G\left[U_{x}^{\prime}\right]$. Any $(u, v)$-path $P$ dominates $u_{1}^{x}$ and $v_{3}^{x}$. It follows that one vertex of the pair is in $\left\{u_{1}^{x}, u_{2}^{x}\right\}$ and another is in $\left\{v_{2}^{x}, v_{3}^{x}\right\}$. It remains to observe that if $u_{2}^{x}\left(v_{2}^{x}\right.$ respectively) is in the pair, then it can be replaced by $u_{1}^{x}$ ( $v_{3}^{x}$ respectively). We solve Set-Restricted $\left|X_{2}\right|$-Disjoint Paths for the pairs of terminals $\left(u_{1}^{x}, v_{3}^{x}\right)$ with domains $U_{x}^{\prime}$ for $x \in X_{2}$. If we get a No-answer, then we discard our guess since there are no $P_{x}$ that satisfy our choices. Otherwise, let $P_{x}^{\prime}$ be the $\left(u_{1}^{x}, v_{3}^{x}\right)$ path in the obtained solution for $x \in X_{2}$. We let $W^{\prime}(x)=P_{x}^{\prime} \cup S(x)$.

We claim that the sets $W^{\prime}(x)$ compose an $H$-witness structure. To show it, observe first that by the construction of these sets, $W^{\prime}(x)$ are disjoint. If $x y \in E_{H}$, then as $s_{x y} \in W^{\prime}(x)$ and $s_{y x} \in W^{\prime}(y), W^{\prime}(x)$ and $W^{\prime}(y)$ are adjacent. It remains to prove that if $x y \notin E_{G}$, then $W^{\prime}(x)$ and $W^{\prime}(y)$ are not adjacent. To obtain a contradiction, assume that $W^{\prime}(x)$ and $W^{\prime}(y)$ are adjacent for some $x, y \in V_{H}$, i.e., there is $u v \in E_{G}$ with $u \in W^{\prime}(x)$ and $v \in W^{\prime}(y)$, where $x y \notin E_{H}$. By the construction of $W^{\prime}(x), W^{\prime}(y), x, y \in X_{2}$. Moreover, $u \notin N_{G}\left[\left\{u_{1}^{x}, u_{2}^{x}, v_{2}^{x}, v_{3}^{x}\right\}\right]$ or $v \notin N_{G}\left[\left\{u_{1}^{y}, u_{2}^{y}, v_{2}^{y}, v_{3}^{y}\right\}\right]$. If $u \notin N_{G}\left[\left\{u_{1}^{x}, u_{2}^{x}, v_{2}^{x}, v_{3}^{x}\right\}\right]$, then we consider $u_{1}^{x}, v_{3}^{x}, u_{1}^{y}$ and observe that these vertices compose an asteroidal triple. Clearly, the $\left(u_{1}^{x}, v_{3}^{x}\right)$-path $P_{x}^{\prime}$ avoids $N_{G}\left[u_{1}^{y}\right]$, because $N_{G}\left[u_{1}^{y}\right] \cap U_{x}=\emptyset$. Because $u \notin N_{G}\left[\left\{u_{1}^{x}, u_{2}^{x}, v_{2}^{x}, v_{3}^{x}\right\}\right], u$ is either in $P_{x}^{\prime}$ or adjacent to a vertex in $P_{x}^{\prime}$ and $v$ is either in $P_{y}^{\prime}$ or adjacent to a vertex in $P_{y}^{\prime}, G\left[W^{\prime}(x) \cup W^{\prime}[y]\right]-N_{G}\left[u_{1}^{x}\right]$ and $G\left[W^{\prime}(x) \cup W^{\prime}[y]\right]-N_{G}\left[v_{3}^{x}\right]$ are connected. Hence, there are $\left(u_{1}^{x}, u_{1}^{y}\right)$ and $\left(v_{3}^{x}, u_{1}^{y}\right)-$ paths that avoid $N_{G}\left[v_{3}^{x}\right]$ and $N_{G}\left[u_{1}^{x}\right]$ respectively. By symmetry, we conclude that if $v \notin N_{G}\left[\left\{u_{1}^{y}, u_{2}^{y}, v_{2}^{y}, v_{3}^{y}\right\}\right]$, then $u_{1}^{y}, v_{3}^{y}, u_{1}^{x}$ is an asteroidal triple. This contradiction proves our claim.

To complete the proof, note that we guess at most $6\left|V_{H}\right|+2\left|E_{H}\right|$ vertices of $G$, and we can consider all possible choices in time $n^{O\left(\left|V_{H}\right|+\left|E_{H}\right|\right)}$, where $n=\left|V_{G}\right|$. If for one of the choices we get an $H$-witness structure, then $H$ is an induced minor of $G$, otherwise we return No. As we can solve Set-Restricted $\left|X_{2}\right|$-Disjoint Paths in time $n^{f\left(\left|V_{H}\right|\right)}$ by Theorem 3, the claim follows.

We complement Theorem 5 as follows. A graph is cobipartite (and consequently AT-free) if its vertex set can be partitioned into two cliques. Clearly, any cobipartite graph is AT-free.

Theorem 6. The $H$-Induced Minor problem is NP-complete for cobipartite graphs, and $\mathrm{W}[1]$-hard for cobipartite graphs when parameterized by $\left|V_{H}\right|$.

Proof. We first give a $\mathrm{W}[1]$-hardness proof that also serves as an NP-hardness proof. We reduce from the well-known W[1]-complete CliQue problem [6]. For a graph $G$ and a parameter $k$, this problem asks whether $G$ has a clique of size $k$. Let $(G, k)$ be an instance of CLIQUE. Without loss of generality we assume that $k \geq 4$. We construct the cobipartite graph $G^{\prime}$ as follows:

- create a copy of $V_{G}$ and construct a clique $U$ on these vertices;
- for each edge $u v \in E_{G}$, create a vertex $e_{u v}$ adjacent to all vertices of $U \backslash\{u, v\}$;
- construct the clique $W=\left\{e_{u v} \mid u v \in E_{G}\right\}$.

Now we construct the graph $H$ :

- create a clique $X$ of size $k$ with vertices $x_{1}, \ldots, x_{k}$;
- create a clique $Y$ with $\frac{1}{2} k(k-1)$ vertices $y_{i j}, 1 \leq i<j \leq k$;
- for each pair $i, j$ with $1 \leq i<j \leq k$, make $x_{h}$ adjacent to $y_{i j}$ for $h \in$ $\{1, \ldots, k\}, h \neq i, j$.

We prove that $G$ has a clique of size $k$ if and only if $H$ is an induced minor of $G^{\prime}$. First suppose that $G$ has a clique $\left\{u_{1}, \ldots, u_{k}\right\}$. Then the subgraph of $G^{\prime}$ induced by this clique and the set of vertices $\left\{e_{u_{i} u_{j}} \mid 1 \leq i<j \leq k\right\}$ is isomorphic to $H$, i.e, $H$ is an induced subgraph of $G^{\prime}$, and therefore an induced minor of $G^{\prime}$.

Now suppose that $H$ is an induced minor of $G^{\prime}$. Let $W(z) \subseteq V_{G^{\prime}}$ for $z \in V_{H}$ be an $H$-witness structure. Note that because $k \geq 4$, each vertex $x_{i} \in U$ is not adjacent to at least three vertices of $H$. Since for each vertex $e_{u v} \in W$ $d_{G}\left(e_{u v}\right)=\left|V_{G}\right|-3$, we find that $W \cap\left(\cup_{i=1}^{k} W\left(x_{i}\right)\right)=\emptyset$ and $\cup_{i=1}^{k} W\left(x_{i}\right) \subseteq U$. Suppose that $U \cap W\left(y_{i j}\right) \neq \emptyset$ for some $1 \leq i<j \leq k$. Then $W\left(y_{i j}\right)$ is adjacent to each set $W\left(x_{h}\right)$ for $h \in\{1, \ldots, k\}$, but $y_{i j}$ is not adjacent to two vertices of $\left\{x_{1}, \ldots, x_{k}\right\}$. This gives us a contradiction, and, therefore, $\cup_{1 \leq i<j \leq k} W\left(y_{i j}\right) \subseteq$ $W$. Now we prove that $|W(z)|=1$ for $z \in V_{H}$. To obtain a contradiction, assume that $|W(z)| \geq 2$ for some $z \in V_{H}$. We have two cases.

Case 1. $e_{u_{1} u_{2}}, e_{v_{1} v_{2}} \in W\left(y_{i j}\right)$ for some $1 \leq i<j \leq k$. Observe that $d_{G}\left(e_{u_{1} u_{2}}\right)=$ $d_{G}\left(e_{v_{1} v_{2}}\right)=\left|V_{G}\right|-3$. Also for $u_{1} u_{2} \neq v_{1} v_{2}, N_{G}\left[e_{u_{1} u_{2}}\right] \neq N_{G}\left[e_{v_{1} v_{2}}\right]$. Hence, $d_{H}\left(y_{i j}\right) \geq\left|V_{H}\right|-2$, but $H$ has no such vertices; a contradiction.

Case 2. $u, v \in W\left(x_{i}\right)$ for some $i \in\{1, \ldots, k\}$. Let $j \in\{1, \ldots, k\}, j \neq i$. Assume without loss of generality that $i<j$ (otherwise consider further the vertex $y_{j i}$ instead of $y_{i j}$ ). The vertex $y_{i j}$ is not adjacent to $x_{i}, y_{j}$. Hence, $W\left(y_{i j}\right)$ is not adjacent to $W\left(x_{i}\right)$ and $W\left(x_{j}\right)$, i.e., the single vertex from $W$ in $W\left(y_{i j}\right)$ is not adjacent to at least three vertices of $U$. It remains to observe that any vertex in $W$ is not adjacent to at most two vertices in $U$; a contradiction.

We conclude that $H$ is an induced subgraph of $G^{\prime}$, and, moreover, the vertices of $X$ are in $U$, and the vertices of $Y$ are in $W$ for the copy of $H$ in $G^{\prime}$. Hence, $X$ is a clique in $G$. This completes the $\mathrm{W}[1]$-hardness proof.

To complete the proof of Theorem 6, it remains to observe that our $\mathrm{W}[1]$ hardness proof immediately implies NP-hardness, as CLIQUE is NP-complete and our reduction is polynomial.

## 5 Contractibility

In this concluding section we give another applications the algorithm for SETRestricted k-Disjoint Paths. We show that it can be used to obtain an algorithm for $H$-Contractibility for the case when $H$ has no triangles.

As with Induced Minor, we represent $H$-Contractibility as a partition problem. An $H$-contraction witness structure of $G$ is a partition of $V_{G}$ into $\left|V_{H}\right|$ non-empty disjoint sets $W(x) \subseteq V_{G}$, one set for each $x \in V_{H}$, called $H$ contraction witness sets, such that
(i) each $W(x)$ is a connected set; and
(ii) for all $x, y \in V_{H}$ with $x \neq y$, sets $W(x)$ and $W(y)$ are adjacent in $G$ if and only if $x$ and $y$ are adjacent in $H$.

Clearly, $H$ is a contraction of $G$ if and only if $G$ has an $H$-contraction witness structure: $H$ can be obtained from $G$ by contracting the edges in each $H$-contraction witness set until a single vertex remains in each of them.

Let $H$ be an induced minor of $G$ with the witness structure $W(x)$ for $x \in V_{H}$ such that $\cup_{x \in V_{H}} W(x)$ is a dominating set of $G$. We say that the witness structure $W$ can be extended to an $H$-contraction witness structure if there is an $H$ contraction witness structure $W^{\prime}(x)$, where $W(x) \subseteq W^{\prime}(x) \subseteq N_{G}[W(x)]$ for $x \in V_{H}$. We need the following lemma.

Lemma 6. Let a triangle-free graph $H$ be an induced minor of $G$ with the corresponding witness structure $W(x)$ for $x \in V_{H}$ such that $\cup_{x \in V_{H}} W(x)$ is a dominating set of $G$. Then it can be decided in polynomial time whether $W$ can be extended to an $H$-contraction witness structure.

Proof. Let $U=V_{G} \backslash \cup_{x \in V_{H}} W(x)$. For a vertex $u \in U$, we say that we assign $u$ to $W(x)$ if we put $u$ in $W^{\prime}(x)$. We assign vertices to the sets $W^{\prime}(x)$ recursively using the following rules.

Rule 1. If for a non-assigned vertex $u \in U$ there is a unique $x \in V_{H}$ such that $u \in N_{G}[W(x)]$, then $u$ is assigned to $W^{\prime}(x)$.

Let $X(u)=\left\{x \in V_{H} \mid u \in N_{G}[W(x)]\right.$ for $u \in U$. Now we can assume that $|X(u)| \geq 2$ for non-assigned vertices of $U$.

Rule 2. If for a non-assigned $u \in U,|X(u)| \geq 3$, then if $H[X(u)]$ is a star with the central vertex $x$, then we assign $x$ to $W^{\prime}(x)$. Otherwise, we stop and return a No-answer. To see the correctness of this rule, note that if $u \in W^{\prime}(x)$,
then $x$ should be adjacent to all other vertices of $X(u)$. Then because $H$ has no triangles, $H[X(u)]$ is a star with the central vertex $x$.

Now we can assume that $X(u)=\left\{x_{1}(u), x_{2}(u)\right\}$ for non-assigned vertices of $U$.

Rule 3. If for a non-assigned $u \in U, x_{1}(u), x_{2}(u)$ are not adjacent in $H$, then we stop and return a No-answer.

Rule 4. If for $u, v \in U$ such that $u v \in E_{G}, u$ is not assigned and $v$ is assigned to $W^{\prime}(y)$, then if $y \notin N_{H}\left[x_{1}(u)\right]\left(y \notin N_{H}\left[x_{2}(u)\right]\right.$ respectively $)$, then $u$ is assigned to $W^{\prime}\left(x_{2}(u)\right)$ (to $W^{\prime}\left(x_{1}(u)\right)$ respectively).

After this rule, it is safe to use the next one.
Rule 5. If for a non-assigned $u \in U$, each $v \in U$ adjacent to $u$ is assigned, then assign $u$ arbitrary to either $W^{\prime}\left(x_{1}(u)\right)$ or $W^{\prime}\left(x_{2}(u)\right)$.

Rule 6. If for $u, v \in U$ such that $u v \in E_{G}, u$ is assigned to $W^{\prime}(x)$ and $v$ is assigned to $W^{\prime}(y)$, then if either $x \neq y$ or $x y \notin E_{H}$, then we stop and return a No-answer.

The remaining assignments are done as follows. Note that any non-assigned $u \in U$ is adjacent to non-assigned vertices of $U$, and for any assigned neighbor $v \in U$, any assignment of $u$ is safe. For each non-assigned $u \in U$ with $X(u)=$ $\left\{x_{1}(u), x_{2}(u)\right\}$, we introduce a Boolean variable $z_{u}$ and assume that $z_{u}=$ true if $u$ is assigned to $W^{\prime}\left(x_{1}(u)\right)$, and $z_{u}=$ false otherwise. For adjacent non-assigned $u, v \in U$, we define a Boolean function $f_{u v}\left(z_{u}, z_{v}\right)$ such that $f_{u v}\left(z_{u}, z_{v}\right)=$ true if and only if for the assignments of $u, v$ to $W^{\prime}\left(x_{i}(u)\right), W^{\prime}\left(x_{j}(v)\right)$ respectively that correspond to the values of $z_{u}, z_{v}$, either $x_{i}(u)=x_{j}(v)$ or $x_{i}(u) x_{j}(v) \in E_{H}$. Clearly, $f_{u v}\left(z_{u}, z_{v}\right)$ can be written in the conjunctive normal form where each clause contains at most two literals. Consider the formula $\phi=\wedge_{u v \in A} f_{u v}\left(z_{u}, z_{v}\right)$, where $A=\left\{u v \in E_{G} \mid u, v \in U\right.$ and $u, v$ are non-assigned $\}$. Note that $\phi$ gives an instance of 2 -Satisfiability that can be solved in linear time [16]. If we get a solution, then we assign $u$ according to the value of $z_{u}$. Otherwise, we return a No-answer.

Now we are ready to prove the main theorem of this section.
Theorem 7. H-Contractibility can be solved in polynomial time on AT-free graphs for any fixed triangle-free graph $H$.

Proof. We check whether $H$ is a minor of $G$ with an $H$-witness structure that can be extended to an $H$-contraction witness structure. To do it we use the same approach as in the proof of Theorem 5.

Suppose that $H$ is a contraction of $G$. Then $G$ has an $H$-contraction witness structure, i.e., a partition $W(x)$ for $x \in V_{H}$ of the set $V_{G}$. For each $x \in V_{H}$, $G[W(x)]$ is a connected AT-free graph. Hence, by Theorem $1, G[W(x)]$ has a dominating pair $\left(u_{x}, v_{x}\right)$.

For each $x \in V_{H}$, we guess the pair $\left(u_{x}, v_{x}\right)$ (it can happen that $\left.u_{x}=v_{x}\right)$, and guess at most six vertices of a shortest $\left(u_{x}, v_{x}\right)$-path $P_{x}$ in $G[W(x)]$ as follows:
if $P_{x}$ has at most five vertices, then we guess all vertices of $P_{x}$, and if $P_{x}$ has at least six vertices, then we guess the first three vertices $u_{1}^{x}, u_{2}^{x}, u_{3}^{x}$ and the last three vertices $v_{1}^{x}, v_{2}^{x}, v_{3}^{x}, u_{x}=u_{1}^{x}, v_{x}=v_{3}^{x}$ such that $u_{1}^{x} \prec_{u_{x}} u_{2}^{x} \prec_{u_{x}} u_{3}^{x} \prec_{u_{x}}$ $v_{1}^{x} \prec_{u_{x}} v_{2}^{x} \prec_{u_{x}} v_{3}^{x}$ in $P_{x}$. Observe that $P_{x}$ is an induced path. We denote by $X_{1}, X_{2}$ the partition of $V_{H}$ (one of the sets can be empty), where for $x \in X_{1}$, all at most five vertices of $P_{x}$ were chosen, and for $x \in X_{2}$, we have the vertices $u_{1}^{x}, u_{2}^{x}, u_{3}^{x}, v_{1}^{x}, v_{2}^{x}, v_{3}^{x}$. Further, for each edge $x y \in E_{H}$, we guess adjacent vertices $s_{x y}, s_{y x} \in V_{G}$, where $s_{x y} \in W(x)$ and $s_{y x} \in W(y)$. Note that the vertices $s_{x y}$ are not necessary distinct, and some of them can coincide with the vertices chosen to represent $P_{x}$. Let $S(x)=\left\{s_{x y} \mid x y \in E_{H}\right\}$. All the guesses should be consistent with the witness structure, i.e., vertices included in distinct $W(x)$ should be distinct, and if $x y \notin E_{H}$, then the vertices included in $W(x)$ and $W(y)$ should be nonadjacent in $G$.

For $x \in X_{1}$, we check whether the guessed path $P_{x}$ dominates $S(x)$, and if it is so, then we let $W^{\prime}(x)=V_{P_{x}} \cup S(x)$. Otherwise we discard our choice.

Recall that we already selected some vertices, and that we cannot use these vertices and also not their neighbors in case non-adjacencies in $H$ forbid this. For each $x \in X_{2}$, we then define the set

$$
\begin{aligned}
U_{x} & =V_{G} \backslash\left(\left(\cup_{y \in X_{1}, x y \in E_{H}} W^{\prime}(y)\right) \cup\left(\cup_{y \in X_{1}, x y \notin E_{H}} N_{G}\left[W^{\prime}(y)\right]\right) \cup\right. \\
& \cup\left(\cup_{y \in X_{2}, x y \in E_{H}}\left(S(y) \cup\left\{u_{1}^{y}, u_{2}^{y}, u_{3}^{y}, v_{1}^{y}, v_{2}^{y}, v_{3}^{y}\right\}\right) \cup\right. \\
& \cup\left(\cup_{y \in X_{2} \backslash\{x\}, x y \notin E_{H} N_{G}\left[S(y) \cup\left\{u_{1}^{y}, u_{2}^{y}, u_{3}^{y}, v_{1}^{y}, v_{2}^{y}, v_{3}^{y}\right\}\right] \cup}\right. \\
& \left.\cup N_{G}\left[\left\{u_{1}^{x}, u_{2}^{x}, v_{2}^{x}, v_{3}^{x}\right\}\right]\right) \cup\left\{u_{1}^{x}, u_{2}^{x}, u_{3}^{x}, v_{1}^{x}, v_{2}^{x}, v_{3}^{x}\right\} .
\end{aligned}
$$

Then for each $x \in X_{2}$, we check whether $S^{\prime}(x)=S(x) \backslash N_{G}\left[\left\{u_{1}^{x}, u_{2}^{x}, v_{2}^{x}, v_{3}^{x}\right\}\right]$ is included in one component of $G\left[U_{x}\right]$. If it is not so, then we discard our choice, since we cannot have a path with the first vertices $u_{1}^{x}, u_{2}^{x}, u_{3}^{x}$ and the last vertices $v_{1}^{x}, v_{2}^{x}, v_{3}^{x}$ that dominates $S(x)$. Otherwise we denote by $U_{x}^{\prime}$ the set of vertices of the component of $G\left[U_{x}\right]$ that contains $S^{\prime}(x)$. Note that $\left(u_{1}^{x}, v_{3}^{x}\right)$ is a dominating pair in $G\left[U_{x}^{\prime}\right]$ for $x \in X_{2}$. To show it, consider a dominating pair $(u, v)$ in $G\left[U_{x}^{\prime}\right]$. Any $(u, v)$-path $P$ dominates $u_{1}^{x}$ and $v_{3}^{x}$. It follows that one vertex of the pair is in $\left\{u_{1}^{x}, u_{2}^{x}\right\}$ and another is in $\left\{v_{2}^{x}, v_{3}^{x}\right\}$. It remains to observe that if $u_{2}^{x}\left(v_{2}^{x}\right.$ respectively) is in the pair, then it can be replaced by $u_{1}^{x}$ ( $v_{3}^{x}$ respectively). We solve Set-Restricted $\left|X_{2}\right|$-Disjoint Paths for the pairs of terminals $\left(u_{1}^{x}, v_{3}^{x}\right)$ with domains $U_{x}^{\prime}$ for $x \in X_{2}$. If we get the No-answer, then we discard our guess since there are no $P_{x}$ that satisfy our choices. Otherwise, let $P_{x}^{\prime}$ be the $\left(u_{1}^{x}, v_{3}^{x}\right)$-path in the obtained solution for $x \in X_{2}$. We let $W^{\prime}(x)=P_{x}^{\prime} \cup S(x)$.

We claim that the sets $W^{\prime}(x)$ compose an $H$-witness structure. To show it we use exactly the same arguments as in the proof of Theorem 5. Observe first that by the construction of these sets, $W^{\prime}(x)$ are disjoint. If $x y \in E_{G}$, then as $s_{x y} \in W^{\prime}(x)$ and $s_{y x} \in W^{\prime}(y), W^{\prime}(x)$ and $W^{\prime}(y)$ are adjacent. It remains to prove that if $x y \notin E_{H}$, then $W^{\prime}(x)$ and $W^{\prime}(y)$ are not adjacent. To obtain a contradiction, assume that $W^{\prime}(x)$ and $W^{\prime}(y)$ are adjacent for some $x, y \in V_{H}$, i.e., there is $u v \in E_{G}$ with $u \in W^{\prime}(x)$ and $v \in W^{\prime}(y)$, where $x y \notin E_{H}$. By the construction of $W^{\prime}(x), W^{\prime}(y), x, y \in X_{2}$. Moreover, $u \notin N_{G}\left[\left\{u_{1}^{x}, u_{2}^{x}, v_{2}^{x}, v_{3}^{x}\right\}\right]$ or $v \notin N_{G}\left[\left\{u_{1}^{y}, u_{2}^{y}, v_{2}^{y}, v_{3}^{y}\right\}\right]$. If $u \notin N_{G}\left[\left\{u_{1}^{x}, u_{2}^{x}, v_{2}^{x}, v_{3}^{x}\right\}\right]$,
then we consider $u_{1}^{x}, v_{3}^{x}, u_{1}^{y}$ and observe that these vertices compose an asteroidal triple. Clearly, the $\left(u_{1}^{x}, v_{3}^{x}\right)$-path $P_{x}^{\prime}$ avoids $N_{G}\left[u_{1}^{y}\right]$, because $N_{G}\left[u_{1}^{y}\right] \cap U_{x}=\emptyset$. Because $u \notin N_{G}\left[\left\{u_{1}^{x}, u_{2}^{x}, v_{2}^{x}, v_{3}^{x}\right\}\right], u$ is either in $P_{x}^{\prime}$ or adjacent to a vertex in $P_{x}^{\prime}$ and $v$ is either in $P_{y}^{\prime}$ or adjacent to a vertex in $P_{y}^{\prime}, G\left[W^{\prime}(x) \cup W^{\prime}[y]\right]-N_{G}\left[u_{1}^{x}\right]$ and $G\left[W^{\prime}(x) \cup W^{\prime}[y]\right]-N_{G}\left[v_{3}^{x}\right]$ are connected. Hence, there are $\left(u_{1}^{x}, u_{1}^{y}\right)$ and $\left(v_{3}^{x}, u_{1}^{y}\right)-$ paths that avoid $N_{G}\left[v_{3}^{x}\right]$ and $N_{G}\left[u_{1}^{x}\right]$ respectively. By symmetry, we conclude that If $v \notin N_{G}\left[\left\{u_{1}^{y}, u_{2}^{y}, v_{2}^{y}, v_{3}^{y}\right\}\right]$, then $u_{1}^{y}, v_{3}^{y}, u_{1}^{x}$ is an asteroidal triple. This contradiction proves our claim.

Suppose now that all our guesses were correct, i.e., the chosen vertices belong to the paths $P_{x}$ and the sets $W(x)$ as it was described.

Now we claim that $\cup_{x \in V_{H}} W^{\prime}(x)$ dominates $G$. Clearly, for $x \in X_{1}, P_{x}$ dominates $W(x)$. For $x \in X_{2}$, by the construction of $U_{x}^{\prime}$, we have that $W(x) \subseteq$ $U_{x}^{\prime} \cup N_{G}\left[\left\{u_{1}^{x}, u_{2}^{x}, v_{2}^{x}, v_{3}^{x}\right\}\right]$. Hence, $W^{\prime}(x)$ dominates $W(x)$. Since the sets $W(x)$ form a partition of $V_{G}$, the claim follows. Hence, the next step of our algorithm is to check whether $\cup_{x \in V_{H}} W^{\prime}(x)$ is a dominating set. If it is not so, then we discard our guesses.

Our next claim is that if the guesses were correct, then the $H$-witness structure $W^{\prime}(x)$ can be extended to an $H$-contraction witness structure. Let $W^{\prime \prime}(x)=W^{\prime}(x) \cup\left(\left(V_{G} \backslash \cup_{x \in V_{H}} W^{\prime}(x)\right) \cap W(x)\right)$. Since $W^{\prime}(x)$ dominates $W(x)$, $W^{\prime}(x) \subseteq W^{\prime \prime}(x) \subseteq N_{G}\left[W^{\prime}(x)\right]$.

We show that $W^{\prime \prime}(x)$ is an $H$-contraction witness structure. Observe that the sets $W^{\prime \prime}(x)$ form a partition of $V_{G}$, and each $W^{\prime \prime}(x)$ is connected by the definition. To obtain a contradiction, assume that there is $u v \in E_{G}$ such that $u \in W^{\prime \prime}(x), v \in W^{\prime \prime}(y), x \neq y$ and $x y \notin E_{H}$. Note that $u \notin W(x)$ or $v \notin W(y)$. If $u \notin W(x)$ or $v \notin W(y)$, then $u \in W^{\prime}(x)$ and $v \in W^{\prime}(y)$, but this leads to a contradiction, since $W^{\prime}$ is an $H$-witness structure. Therefore, we can assume that $u \in W^{\prime}(x) \backslash W(x)$ and $v \in W(y)$. Then $v \in W(y) \backslash W^{\prime}(y)$. If $x \in X_{1}$, then $W^{\prime}(x) \subseteq W(x)$ and $W^{\prime}(x) \backslash W(x)=\emptyset$. Hence, $x \in X_{2}$. Since $\left\{u_{1}^{x}, u_{2}^{x}, v_{2}^{x}, v_{3}^{x}\right\} \subseteq$ $W(x), v \notin N_{G}\left[\left\{u_{1}^{x}, u_{2}^{x}, v_{2}^{x}, v_{3}^{x}\right\} \cup S(x)\right]$, and, moreover, $G[W(y)]$ contains a $\left(u_{1}^{y}, v\right)$ path $P$ that avoids $N_{G}\left[\left\{u_{1}^{x}, u_{2}^{x}, v_{2}^{x}, v_{3}^{x}\right\} \cup S(x)\right]$. Now we prove that $u_{1}^{x}, v_{3}^{x}, u_{1}^{y}$ is am asteroidal triple. The $\left(u_{1}^{x}, v_{3}^{x}\right)$-path $P_{x}$ avoids $N_{G}\left(u_{1}^{y}\right)$. If $u \in V_{P_{x}}$, then $u \neq u_{1}^{x}, u_{2}^{x}, v_{2}^{x}, v_{3}^{x}$ because $v$ is adjacent to $u$. Then the concatenation of $P, v u$ and $\left(u, u_{1}^{x}\right)$-subpath of $P_{x}^{\prime}\left(\left(u, v_{3}^{x}\right)\right.$-subpath of $P_{x}^{\prime}$ respectively) gives a $\left(u_{1}^{y}, u_{1}^{x}\right)$ path that avoids $N_{G}\left[v_{3}^{x}\right]\left(N_{G}\left[v_{3}^{x}\right]\right.$ respectively). If $u \notin V_{P_{x}}$, then $u \in S(x)$. But then $v \notin N_{G}[S(x)]$, a contradiction.

Using this claim, we check whether the $H$-witness structure $W^{\prime}(x)$ can be extended to an $H$-contraction witness structure using Lemma 6 . If we get an $H$-contraction witness structure, then we conclude that $H$ is a contraction of $G$.

To complete the proof of the theorem, note that we guess at most $6\left|V_{H}\right|+2\left|E_{H}\right|$ vertices of $G$, and we can consider all possible choices in time $n^{O\left(\left|V_{H}\right|+\left|E_{H}\right|\right)}$, where $n=\left|V_{G}\right|$. If for one of the choices we get an $H$-witness structure that can be extended to an $H$-contraction witness structure, then $H$ is a contraction of $G$, otherwise we return No. Since, we can solve Set-Restricted $\left|X_{2}\right|$-Disjoint Paths in time $n^{f\left(\left|V_{H}\right|\right)}$ by Theorem 3 and we can decide in
polynomial time whether an $H$-witness structure can be extended to an $H$ contraction witness structure by Lemma 6, the claim follows.

The join of two vertex-disjoint graphs $G_{1}=\left(V_{1}, E_{1}\right)$ and $G_{2}=\left(V_{2}, E_{2}\right)$ is the graph $G_{1} \bowtie G_{2}=\left(V_{1} \cup V_{2}, E_{1} \cup E_{2} \cup\left\{u v \mid u \in V_{1}, v \in V_{2}\right\}\right)$. Van 't Hof et al. in [12] showed that a graph $G$ contains a graph $H$ as an induced minor if and only if $K_{1} \bowtie G$ contains $K_{1} \bowtie H$ as a contraction [12]. This fact together with Theorem 6 yields Corollary 1.

Corollary 1. H-Contractibility is NP-complete for cobipartite graphs, and $\mathrm{W}[1]$-hard for cobipartite graphs when parameterized by $\left|V_{H}\right|$.

Determining the complexity classification of H -Contractibility on ATfree graphs when $H$ is a fixed graph that is not triangle-free is an open problem.
