Preface

Recently, the area of autonomous agents and multiagent systems (MAS) has grown into a promising technology offering a credible alternative for the design of intelligent and cooperative systems. Several efforts have been made by academic researchers, by industrials and by several standardization consortiums in order to provide novel tools, methods and frameworks to establish the necessary standards for a wide use of MAS as a technology in its own right and not only as a new paradigm.

However, until now the main focus of the MAS community has been on the development of *formal and informal tools* (e.g. MASIF as OMG specifications, FIPA), *concepts* (e.g. concerning mental or social attitudes, communication, co-operation, organization, mobility) and *techniques* (e.g. AUML, modal languages, verification techniques) in order to *analyze and specify multiagent systems*.

We are convinced that the next step will concern the development of programming languages and tools which can effectively support MAS programming and *implement key concepts of multiagent systems in a unified framework*. The success of agent oriented system design is guaranteed if we can bridge the gap between analysis and implementation, and thus develop powerful and general purpose programming technology such that the concepts and specifications for multiagent systems can be easily and directly implemented.

This technology should include *agent based programming languages, tools and techniques*: these were the themes of the Dagstuhl seminar *Programming Multi Agent Systems Based on Logic* (see [2] and the recent [1]), where the focus was on logic-based approaches. During the seminar, the idea came up to broaden the scope beyond logic-based frameworks and thus ProMAS came into being.

ProMAS 2003, the *First International Workshop on Programming Multiagent Systems: Languages, Frameworks, Techniques and Tools*, was held in July 2003, in Melbourne (Australia) as an associated event of AAMAS 2003: the main international conference dedicated to autonomous agents and multiagents systems. ProMAS 2003 (<http://www.cs.uu.nl/ProMAS>) was the first international workshop dedicated to MAS programming and it will be followed this year by ProMAS 2004, which will also take place within AAMAS 2004 (July 2004 in New York City, USA).

ProMAS 2003 was an invaluable opportunity that brought together leading researchers from both academia and industry to discuss the design of programming languages for multiagent systems. In particular, the workshop promoted the discussion and exchange of ideas concerning the concepts, properties, requirements, and principles that are important for future programming technology for multiagent systems.

This volume of the LNAI series constitutes the official (post-) proceedings of ProMAS 2003. It presents the main conclusions of the ProMAS event. Besides eight high quality papers selected among the (fifteen) submitted papers, we also invited three leading researchers working in industry. While the workshop

papers represent mainly basic research, the invited papers describe work that is applied in various industrial applications. The eleven papers in this volume can be roughly divided into the following three groups.

Programming MAS: This section consists of three papers. *Keith Decker* describes in his paper a new vision for programming multiagent systems and presents a toolkit for MAS applications: DECAF. *Rick Everts* *et al.* describe how to implement industrial applications of MAS using their system JACK. *Jörg Müller* *et al.* relate the problem of programming software agents with designing executable business processes.

Languages for MAS: This section consists of three papers. *Rafael Bordini* *et al.* relate AgentSpeak, a planning language for autonomous agents, to a general purpose Java model checker. They consider the important problem of verifying multiagent programs. *Amal El Fallah Seghrouchni* *et al.* describe a computational language for autonomous and intelligent mobile agents. *Mehdi Dastani* *et al.* introduce a programming language for cognitive agents that have beliefs, goals, plans. The syntax and semantics of this programming language are presented.

Principles and Tools for MAS: This section consists of five papers. *Paul Scerri* *et al.* present a proxy architecture and team oriented programming method that allow effective coordination between large teams of heterogeneous agents. *Shamimaboy Paurobally* *et al.* consider methods and tools to develop agent interaction protocols. They can be used to bridge the gap between intuitive developments and formal specifications. *Martin Kollingbaum* and *Timothy Norman* are concerned with agent architectures and aim to bridge the gap between analysis and programming (or theory and practice) of agent systems. *Martin Dinkloh* and *Jens Niemis* present a graphical tool which helps in integrating the design and implementation of agent conversations. Finally, *Bruno Mermel* *et al.* introduce a method for designing and validating multiagent systems.

We would like to thank all the contributors, PC members and referees for their outstanding contribution to the success of ProMAS 2003. We are especially thankful to AAMAS 2003 organizers and Simon Parsons for their technical support and for hosting ProMAS 2003.

March 2004

Workshop Organization

Organizing Committee

Mehdi Dastani	Utrecht University (The Netherlands)
Jürgen Dix	Technical University of Clausthal (Germany)
Amal El Fallah Seghrouchni	University of Paris 6 (France)
David Kinny	Agentis Software (Australia)

Program Committee

Rafael Bordini	University of Liverpool (UK)
Jean-Pierre Briot	University of Paris 6 (France)
Mehdi Dastani	Utrecht University (The Netherlands)
Yves Demazeau	University Joseph Fourier (France)
Virginia Dignum	Utrecht University (The Netherlands)
Jürgen Dix	Technical University of Clausthal (Germany)
Amal El Fallah-Seghrouchni	University of Paris 6 (France)
Michael Fisher	University of Liverpool (UK)
David Kinny	Agentis Software (Australia)
John-Jules Meyer	Utrecht University (The Netherlands)
Oliver Obst	Koblenz-Landau University (Germany)
Julian Padget	University of Bath (UK)
Leendert van der Torre	CWI (The Netherlands)
Cees Witteveen	Delft University (The Netherlands)

Additional Referee

Birna van Riemsdijk	Utrecht University (The Netherlands)

Table of Contents

Section I: Programming Multiagent Systems

A Vision for Multi-agent Systems Programming	1
<i>Keith Decker</i>	
Implementing Industrial Multi-agent Systems Using JACK TM	18
<i>Rick Everts, Martyn Fletcher, Richard Jones, Jacquie Jarvis, James Brusey, and Sandy Dance</i>	
Programming Software Agents as Designing Executable Business Processes: A Model-Driven Perspective	49
<i>Jörg P. Müller, Bernhard Bauer, and Thomas Fries</i>	

Section II: Languages for Multiagent Systems

Verifiable Multi-agent Programs	72
<i>Rafael H. Bordini, Michael Fisher, Willem Visser, and Michael Wooldridge</i>	
CLAIM: A Computational Language for Autonomous, Intelligent and Mobile Agents	90
<i>Amal El Fallah-Seghrouchni and Alexandru Suna</i>	
A Programming Language for Cognitive Agents Goal Directed 3APL	111
<i>Mehdi Dastani, M. Birna van Riemsdijk, Frank Dignum, and John-Jules Ch. Meyer</i>	

Section III: Principles and Tools for Multiagent Systems

Team Oriented Programming and Proxy Agents: The Next Generation	131
<i>Paul Scerri, David V. Pynadath, Nathan Schurr, Alessandro Farinelli, Sudeep Gandhe, and Milind Tambe</i>	
Developing Agent Interaction Protocols Using Graphical and Logical Methodologies	149
<i>Shamimabi Paurobally, Jim Cunningham, and Nicholas R. Jennings</i>	
Norm Adoption and Consistency in the NoA Agent Architecture	169
<i>Martin J. Kollingbaum and Timothy J. Norman</i>	

A Tool for Integrated Design and Implementation of Conversations in Multiagent Systems	187
<i>Martin Dinkloh and Jens Nimis</i>	
SPACE: A Method to Increase Tracability in MAS Development	201
<i>Bruno Mermet, Gaëlle Simon, Dominique Fournier, and Marianne Flouret</i>	
Author Index	221
