Preface

This volume contains the papers presented at the workshop on Job Scheduling Strategies for Parallel Processing held in Honolulu, Hawaii, as a prelude to the IPPS'96 conference. All the papers have gone through the usual refereeing process with the full version being read and evaluated by at least five members of the program committee. We would like to take this opportunity to thank the program committee, Nawaf Bitar, David Black, Jim Cownie, Allan Gottlieb, Scott Hahn, Mal Kalos, Phil Krueger, Richard Lagerstrom, Miron Livny, Virginia Lo, Reagan Moore, Ken Sevcik, Mark Squillante, Bernard Traversat, and John Zahorjan, for an excellent job. Thanks are also due to the authors for their submissions, presentations, and final revisions for this volume. We would like to thank the MIT Laboratory for Computer Science and the Computer Science Institute at Hebrew University for the use of their facilities in preparation of these proceedings.

As multi-user parallel supercomputers become more widespread, job scheduling takes on a crucial role. The number of users of parallel supercomputers is growing at an even faster pace and so there is an increasing number of users who must share a parallel computer's resources. Job scheduling strategies must address this need.

There is a spectrum of groups that are interested in job scheduling strategies for parallel processors. At one end are the vendors of parallel supercomputers who supply the scheduling software for managing jobs on their machines. In the middle are researchers in academia, National Labs, and industrial research labs who propose new scheduling strategies and methods for evaluating and comparing them. At the other end of the spectrum are the users and providers of parallel processing resources who have a set of demands and requirements.

This is the second occurrence of the workshop. The previous workshop was held a year earlier, as part of the IPPS'95 conference in Santa Barbara. The proceedings of that workshop have been published as Springer-Verlag Lecture Notes in Computer Science Vol. 949.

At the workshop there were many interesting discussions between people in the three groups (but we were too busy to be part of many of them). We were encouraged by this since we believe it is important to increase communication so that academics work on the right problems and vendors and computation centers make the best use of the novel solutions. We hope these proceedings help parallel supercomputing to achieve its fundamental goal of satisfying the needs of the user.

Jerusalem, August 1996

Contents

Towards Convergence in Job Schedulers for Parallel Supercomputers	1
Dror G. Feitelson and Larry Rudolph	
Workload Evolution on the Cornell Theory Center IBM SP2	27
Steven Hotovy	
The EASY - LoadLeveler API Project	41
Joseph Skovira, Waiman Chan, Honbo Zhou, and David Lifka	
A Batch Scheduler for the Intel Paragon MPP System with a Non-contiguous Node Allocation Algorithm	48
Michael Wan, Reagan Moore, George Kremenek, and Ken Steube	
Architecture-Independent Request-Scheduling with Tight Waiting-Time Estimations	65
Jörn Gehring and Friedhelm Rammé	
Packing Schemes for Gang Scheduling	89
Dror G. Feitelson	
A Gang Scheduling Design for Multiprogrammed Parallel Computing Environments	111
Fang Wang, Hubertus Franke, Marios Papaefthymiou, Pratap Pattnaik, Larry Rudolph, and Mark S. Squillante	
Implementation of Gang-Scheduling on Workstation Cluster	126
Atsushi Hori, Hiroshi Tezuka, Yutaka Ishikawa, Noriyuki Soda, Hiroki Konaka, and Munenori Maeda	
Managing Checkpoints for Parallel Programs	140
Jim Pruyne and Miron Livny	
Using Runtime Measured Workload Characteristics in Parallel Processor Scheduling	155
Thu D. Nguyen, Raj Vaswani, and John Zahorjan	
Parallel Application Characteristics for Multiprocessor Scheduling Policy Design	175
Thu D. Nguyen, Raj Vaswani, and John Zahorjan	
Dynamic vs. Static Quantum-Based Parallel Processor Allocation	200
Su-Hui Chiang and Mary Vernon	
Dynamic versus Adaptive Processor Allocation Policies for Message Passing Parallel Computers: An Empirical Comparison	224
Jitendra D. Padhye and Lawrence W. Dowdy	

Dynamic Partitioning in Different Distributed-Memory Environments	244
