Foreword

The management and processing of uncertain information has shown itself to be a crucial issue in the development of intelligent systems, beginning with its appearance in such seminal systems as Mycin and Prospector. The papers in this volume reflect the current range of interests of researchers in the field. Currently, the major approaches to uncertainty include fuzzy set theory, probabilistic methods, mathematical theory of evidence, non-standard logics such as default reasoning, and possibility theory.

The initial part of this volume is devoted to papers dealing with the foundations of these approaches. Recent attempts have been made to develop systems combining multiple approaches. Work in this direction is also reflected in this book. A significant portion of the book looks at the management of uncertainty in a number of the paradigmatic domains of intelligent systems such as expert systems, decision-making, data bases, image processing and reasoning networks.

The papers in this volume are extended versions of presentations at the third International Conference on Information Processing and Management of Uncertainty in knowledge-based systems (IPMU Conference). Two other companion volumes exist, based on the first two IPMU Conferences, entitled "Uncertainty in Knowledge-Based Systems" (LNCS 286) and "Uncertainty and Intelligent Systems" (LNCS 313). We would like to express our thanks to all the authors in this volume, as well as all the participants at IPMU '90. Special thanks are given to Ecole Nationale Supérieure de Techniques Avancées, who hosted the Conference, and to all the other sponsors of the Conference.
