# Preface

Most theorem provers support a fixed logic, such as first-order or equational logic. They bring sophisticated proof procedures to bear upon the conjectured formula. The resolution prover Otter [60] is an impressive example.

ALF [30], Coq [14] and Nuprl [9] each support a fixed logic too. These are higher-order type theories, explicitly concerned with computation and capable of expressing developments in constructive mathematics. They are far removed from classical first-order logic.

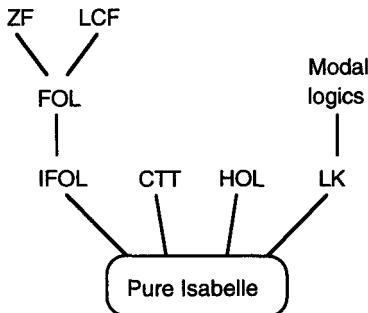

A diverse collection of logics — type theories, process calculi,  $\lambda$ -calculi — may be found in the Computer Science literature. Such logics require proof support. Few proof procedures are known for them, but the theorem prover can at least automate routine steps.

A **generic** theorem prover is one that supports a variety of logics. Some generic provers are noteworthy for their user interfaces [11, 29, 55]. Most of them work by implementing a syntactic framework that can express typical inference rules. Isabelle's distinctive feature is its representation of logics within a fragment of higher-order logic, called the meta-logic. The proof theory of higher-order logic may be used to demonstrate that the representation is correct [43]. The approach has much in common with the Edinburgh Logical Framework [24] and with Felty's [18] use of  $\lambda$ Prolog to implement logics.

An inference rule in Isabelle is a generalized Horn clause. Rules are joined to make proofs by resolving such clauses. Logical variables in goals can be instantiated incrementally. But Isabelle is not a resolution theorem prover like Otter. Isabelle's clauses are drawn from a richer language and a fully automatic search would be impractical. Isabelle does not resolve clauses automatically, but under user direction. You can conduct single-step proofs, use Isabelle's built-in proof procedures, or develop new proof procedures using tactics and tacticals.

Isabelle's meta-logic is higher-order, based on the simply typed  $\lambda$ -calculus. So resolution cannot use ordinary unification, but higher-order unification [27]. This complicated procedure gives Isabelle strong support for many logical formalisms involving variable binding.

The diagram below illustrates some of the logics distributed with Isabelle. These include first-order logic (intuitionistic and classical), the sequent calculus, higher-order logic, Zermelo-Fraenkel set theory [56], a version of Constructive Type Theory [39], several modal logics, and a Logic for Computable Functions [42]. Several experimental logics are being developed, such as linear logic.

## How to read this book

Isabelle is a complex system, but beginners can get by with a few commands and a basic knowledge of how Isabelle works. Some knowledge of Standard ML is essential because ML is Isabelle's user interface. Advanced Isabelle theorem proving can involve writing ML code, possibly with Isabelle's sources at hand. My book on ML [46] covers much material connected with Isabelle, including a simple theorem prover.

The Isabelle documentation is divided into three parts, which serve distinct purposes:

- *Introduction to Isabelle* describes the basic features of Isabelle. This part is intended to be read through. If you are impatient to get started, you might skip the first chapter, which describes Isabelle's meta-logic in some detail. The other chapters present on-line sessions of increasing difficulty. It also explains how to derive rules define theories, and concludes with an extended example: a Prolog interpreter.
- *The Isabelle Reference Manual* provides detailed information about Isabelle's facilities, excluding the object-logics. This part would make boring reading, though browsing might be useful. Mostly you should use it to locate facts quickly.
- *Isabelle's Object-Logics* describes the various logics distributed with Isabelle. The chapters are intended for reference only; they overlap somewhat so that each chapter can be read in isolation.

This book should not be read from start to finish. Instead you might read a couple of chapters from *Introduction to Isabelle*, then try some examples referring to the other parts, return to the *Introduction*, and so forth. Starred sections discuss obscure matters and may be skipped on a first reading.

## Releases of Isabelle

Isabelle was first distributed in 1986. The 1987 version introduced a higher-order meta-logic with an improved treatment of quantifiers. The 1988 version added limited polymorphism and support for natural deduction. The 1989 version included a parser and pretty printer generator. The 1992 version introduced type classes, to support many-sorted and higher-order logics. The 1993 version provides greater support for theories and is much faster.

Isabelle is still under development. Projects under consideration include better support for inductive definitions, some means of recording proofs, a graphical user interface, and developments in the standard object-logics. I hope but cannot promise to maintain upwards compatibility.

Isabelle is available by anonymous ftp:

- University of Cambridge  
host `ftp.cl.cam.ac.uk`  
directory `ml`
- Technical University of Munich  
host `ftp.informatik.tu-muenchen.de`  
directory `local/lehrstuhl/nipkow`

The electronic distribution list `isabelle-users@cl.cam.ac.uk` provides a forum for discussing problems and applications involving Isabelle. To join, send me a message via `lcp@cl.cam.ac.uk`. Please notify me of any errors you find in this book.

## Acknowledgements

Tobias Nipkow has made immense contributions to Isabelle, including the parser generator, type classes, the simplifier, and several object-logics. He also arranged for several of his students to help. Carsten Clasohm implemented the theory database; Markus Wenzel implemented macros; Sonia Mahjoub and Karin Nimmermann also contributed.

Nipkow and his students wrote much of the documentation underlying this book. Nipkow wrote the first versions of Sect. 3.2, Sect. 9.1, Chap. 10, Chap. 13 and App. A. Carsten Clasohm contributed to Chap. 9. Markus Wenzel contributed to Chap. 11. Nipkow also provided the quotation at the front.

David Aspinall, Sara Kalvala, Ina Kraan, Chris Owens, Zhenyu Qian, Norbert Völker and Markus Wenzel suggested changes and corrections to the documentation.

Martin Coen, Rajeev Goré, Philippe de Groote and Philippe Noël helped to develop Isabelle's standard object-logics. David Aspinall performed some useful research into theories and implemented an Isabelle Emacs mode. Isabelle was developed using Dave Matthews's Standard ML compiler, Poly/ML.

The research has been funded by numerous SERC grants dating from the Alvey programme (grants GR/E0355.7, GR/G53279, GR/H40570) and by ESPRIT (projects 3245: Logical Frameworks and 6453: Types).

# Table of Contents

<b>I</b>	<b>Introduction to Isabelle</b>	<b>1</b>
1	Foundations . . . . .	3
1.1	Formalizing logical syntax in Isabelle . . . . .	3
1.2	Formalizing logical rules in Isabelle . . . . .	7
1.3	Proof construction in Isabelle . . . . .	11
1.4	Lifting a rule into a context . . . . .	15
1.5	Backward proof by resolution . . . . .	17
1.6	Variations on resolution . . . . .	21
2	Getting Started with Isabelle . . . . .	25
2.1	Forward proof . . . . .	25
2.2	Backward proof . . . . .	30
2.3	Quantifier reasoning . . . . .	34
3	Advanced Methods . . . . .	41
3.1	Deriving rules in Isabelle . . . . .	41
3.2	Defining theories . . . . .	46
3.3	Theory example: the natural numbers . . . . .	52
3.4	Refinement with explicit instantiation . . . . .	55
3.5	A Prolog interpreter . . . . .	58
<b>II</b>	<b>The Isabelle Reference Manual</b>	<b>63</b>
4	Basic Use of Isabelle . . . . .	65
4.1	Basic interaction with Isabelle . . . . .	65
4.2	Ending a session . . . . .	66
4.3	Reading ML files . . . . .	66
4.4	Printing of terms and theorems . . . . .	66
4.5	Displaying exceptions as error messages . . . . .	68
4.6	Shell scripts . . . . .	68

XII      Table of Contents

5	Proof Management: The Subgoal Module . . . . .	71
5.1	Basic commands . . . . .	71
5.2	Shortcuts for applying tactics . . . . .	74
5.3	Executing batch proofs . . . . .	76
5.4	Managing multiple proofs . . . . .	77
5.5	Debugging and inspecting . . . . .	78
6	Tactics . . . . .	81
6.1	Resolution and assumption tactics . . . . .	81
6.2	Other basic tactics . . . . .	83
6.3	Obscure tactics . . . . .	85
6.4	Managing lots of rules . . . . .	87
6.5	Programming tools for proof strategies . . . . .	89
6.6	Sequences . . . . .	90
7	Tacticals . . . . .	93
7.1	The basic tacticals . . . . .	93
7.2	Control and search tacticals . . . . .	95
7.3	Tacticals for subgoal numbering . . . . .	98
8	Theorems and Forward Proof . . . . .	101
8.1	Basic operations on theorems . . . . .	101
8.2	Primitive meta-level inference rules . . . . .	105
8.3	Derived rules for goal-directed proof . . . . .	109
9	Theories, Terms and Types . . . . .	113
9.1	Defining theories . . . . .	113
9.2	Loading a new theory . . . . .	115
9.3	Reloading modified theories . . . . .	116
9.4	Basic operations on theories . . . . .	118
9.5	Terms . . . . .	119
9.6	Variable binding . . . . .	120
9.7	Certified terms . . . . .	121
9.8	Types . . . . .	122
9.9	Certified types . . . . .	122
10	Defining Logics . . . . .	125
10.1	Priority grammars . . . . .	125
10.2	The Pure syntax . . . . .	126
10.3	Mixfix declarations . . . . .	131
10.4	Example: some minimal logics . . . . .	136
11	Syntax Transformations . . . . .	139
11.1	Abstract syntax trees . . . . .	139
11.2	Transforming parse trees to ASTs . . . . .	140
11.3	Transforming ASTs to terms . . . . .	142

11.4	Printing of terms . . . . .	142
11.5	Macros: Syntactic rewriting . . . . .	144
11.6	Translation functions . . . . .	150
12	Substitution Tactics . . . . .	153
12.1	Substitution rules . . . . .	153
12.2	Substitution in the hypotheses . . . . .	154
12.3	Setting up <code>hyp_subst_tac</code> . . . . .	155
13	Simplification . . . . .	157
13.1	Simplification sets . . . . .	157
