The original version of the article was published with a mis-calculated equation. In section “Procedures of determining the RIRs”, the last equation under Step 3 should read as:

The upper-class average importance rating is:

$$\begin{aligned} AIR_u(R^*) &= 0.2 \times \left[3, \frac{11}{3} \right] + 0.3 \times \left[3, \frac{11}{3} \right] + 0.5 \times \left[\frac{11}{3}, 5 \right] \\ &= \left[\frac{10}{3}, \frac{13}{3} \right] \end{aligned}$$

the rest of the calculations in the example should follow this result thereafter.

The original article can be found online at <https://doi.org/10.1007/s10845-016-1224-z>.
