Robert A. Stegwee, University of Twente, The Netherlands

The design and development of e-health systems is studied on an organizational, national and international level. On an organizational level, a method is described for modeling the patient care process. On a national level the experiences with respect to the implementation of a national electronic prescription system are reported and analysed. At the international level the influence of national culture on the design of e-health systems is studied in five different countries.
