

New this year to ISMAR 2013, we are proud to present the Works In Progress (WIP) Program. Augmented Reality is rapidly growing into many new areas, so the WIP is a platform to present the field's latest, emerging results to the larger community before the work has reached its final form. This year, the program includes bread and butter AR technologies such as remote collaboration interfaces, fiducial marker design, and perceptual studies, to even loftier applications like AR interactions aboard the International Space Station. Passive haptics, bare-handed gesture interfaces, and realistic rendering round out the offerings. So come to the WIP sessions to hear about active AR research and find the spark of inspiration!
