Special Issue on Complex Systems in Finance and Economics

FINANCE and economics are complex domains, in which multiple components such as investors, trading venues, or intermediary firms frequently interact to generate aggregate outcomes that may be desirable or undesirable, intended or unintended. The behavior of the underlying elements is often adaptive and the aggregate dynamics can be highly nonlinear. The resulting complexity can therefore be difficult to measure, model, and control. The recent financial crisis revealed how interconnections between institutions can provide feedback loops and propagation channels across the financial system, nationally and globally, spilling into the real economy. There is a great need for advances in the ways in which financial and economic systems are modeled, simulated, designed, controlled, and regulated. The techniques and hybrid approaches emerging from the ongoing efforts of the systems community can help address the challenge.

The financial system is not formally engineered, but has emerged organically as an amalgam of firms, trading venues, industry sectors, jurisdictions, and regulations. Operational risks are monitored and managed primarily at the level of system components (firms and trading venues), leaving a significant gap in our understanding of vulnerabilities at the level of the system as a whole and for various subsystems. The management of systemic financial fragilities is better and improving rapidly since the 2007–09 crisis but much remains to be done. In this regard, we should highlight the importance of new research on key areas like the measurement, analysis, and management of operational and financial hazards arising from the interaction of participants and subsystems of the financial system.

A large and growing fraction of financial flows among system participants occur in the context of securities markets, both organized exchanges and decentralized over-the-counter markets. Understanding the financial system therefore requires a detailed understanding of securities market microstructures. Relevant research topics in this space include empirical analyses, theoretical models, and simulation studies of trading architectures, payment flows, and collateral deliveries.

Economists have long recognized the important role of emergent, system-level phenomena, such as liquidity, complexity, and fragility, for the smooth functioning of the financial system. However, developing models and measures for these system-level phenomena can be maddeningly challenging, and most

extant research has focused on isolated subsystems, such as equities markets, foreign exchange markets, etc. More research is needed to model emergent phenomena, especially as they affect multiple subsystems simultaneously.

It is clear that financial stress can generate interesting dynamics, such as default spillovers and fire-sale feedback loops, as shocks propagate through the system. These dynamics can be very difficult to capture in closed-form theoretical models. System simulations, including agent-based simulations, are a natural alternative research methodology in this context. Interesting topics include simulation of the dynamics of global, national, or local financial systems or subsystems.

The study of system dynamics naturally involves government supervisors, who have the resources and legal authorities to intervene in exigent circumstances. Policymakers' responses to evolving circumstances can have a significant impact—for good or for ill—on the ultimate outcome. There is therefore an important need for research into design of optimal policies for regulatory decision-making and analysis to control of systemic dynamics.

Historically, systemic monitoring has involved a hodge-podge of supervisors, central banks, market participants, and self-regulatory organizations relying on public market data, accounting statements, and on-site examinations to track the status of the system. As the pace of activity changes—for example, through the growth of high-frequency trading—the need also increases for improved tools and techniques for system instrumentation and monitoring, especially during episodes of financial crisis, when system state may evolve very rapidly and unpredictably.

Systemic crises are rare events, typically with important idiosyncrasies. This presents significant challenges to purely econometric or statistical methodologies. A better understanding is needed of the appropriate tools, techniques, and policy frameworks for ex-post forensic data collection and analysis for systemic financial events, so that supervisors and system participants can draw the appropriate lessons from them.

In this special issue we present two interesting articles focused on this space.

In the first one, Germán Creamer focuses his contribution on the study of the mechanisms of financial instability and risk that result from the interaction of the dynamics of social groups and financial products. In his article, “Network Structure and Systemic Risk in the European Equity Market,” he introduces

a methodology to calculate systemic risk using qualitative and quantitative variables that capture communicative and financial activity within equity networks. His analysis illustrates how changes in the network structures might be associated with volatility changes or with systemic risk. The author proposes a component causality index based on centrality indicators that anticipates or moves together with volatility during the period 2005–11.

In the second article, Gerasimos Rigatos and Pierluigi Siano present a systematic method for forecasting default probabilities for financial firms that service power corporations. The solution that they introduce is based on the concept that credit risk is determined by the distance between the debt value and the asset value. They estimate the latter through its relationship with company's market value using a variation on the derivative-free nonlinear Kalman filter. The authors redesign the derivative-free nonlinear Kalman filter as an m-step ahead predictor to obtain estimates of the company's future option values. This information subsequently allows forecasting the associated asset value and volatility and, with that, the default risk.

(Cambridge University Press, 2014).

Alexander Lipton is the Founder and CEO of Stronghold Labs, Co-Founder of Distilled Analytics, Partner with Numeraire Financial, Connection Science Fellow with MIT, and a Visiting Professor of financial engineering with École Polytechnique Fédérale de Lausanne, Lausanne, France. He is an advisory board member with several FinTech Companies. In 2016, he left Bank of America Merrill Lynch, where he served for ten years in various senior managerial roles including Quantitative Solutions Executive and Co-Head of the Global Quantitative Group. Earlier, he held senior managerial positions at Citadel Investment Group, Credit Suisse, Deutsche Bank, and Bankers Trust. In parallel, he held several prestigious academic appointments with NYU, Oxford University, Imperial College, and the University of Illinois. Before switching to finance, he was a Full Professor of mathematics with the University of Illinois. He has authored or coauthored seven books and more than hundred scientific papers. His next book *Financial Engineering—Selected Works of Alexander Lipton* is to appear shortly.

Dr. Alex was awarded the first ever Quant of the Year Award by *Risk Magazine*.

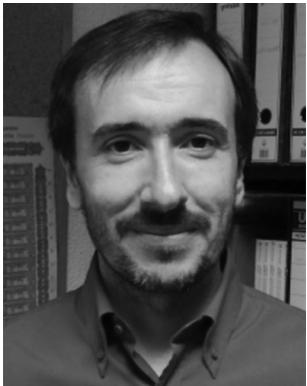

In our opinion, these two articles pose significant contributions to the field of complex systems in Finance and Economics.

M. FLOOD, Guest Editor
Office of Financial Research
U.S. Department of the Treasury

A. LIPTON, Guest Editor
Stronghold Labs
Chicago IL 60601, USA

D. QUINTANA, Guest Editor
Universidad Carlos III de Madrid
Av. Universidad 30
Leganés 28911, Spain

A. SERGUEVA, Guest Editor
nChain, London, U.K.
Systemic Risk Centre
London School of Economics
London WC2A 2AE, U.K.

David Quintana received the Bachelor's degree in business administration and the Ph.D. degree in finance from the Universidad Pontificia Comillas (ICADE), Madrid, Spain, the Bachelor's degree in computer science from the Universidad Nacional de Educación a Distancia, Madrid, and the M.S. degree in intelligent systems from the Universidad Carlos III de Madrid, Getafe, Spain.

He is an Interim Associate Professor with the Department of Computer Science, Universidad Carlos III de Madrid, where he is a part of the bio-inspired algorithms group EVANNAI. He has visited at Inria Futurs, Stanford University, University of Genoa, and the University of Geneva. His current research interests include applications of evolutionary computation and artificial neural networks in finance and economics.

Dr. Quintana is the current Chair of the Computational Finance and Economics Technical Committee of the IEEE Computational Intelligence Society. He has been a Guest Editor for scholarly publications such as *Computational Intelligence* and *AI Communications*, and he has co-chaired special sessions at several international conferences.

Antoaneta Sergueva (M'02–SM'11) received the M.Sc. degree in systems engineering from the Technical University of Sofia, Bulgaria, the MBA in finance from the University of National and World Economy, Sofia, and the Ph.D. degree in computer science from Brunel University, London, U.K.

She is a Senior Researcher with nChain, focused on blockchain research and applications, and has been a quant consultant for investment funds. She became aware of regulatory priorities in systemic risk during fellowships at the Bank of England, Bank of Mexico, Federal Reserve, and U.S. Treasury. She is a Research Associate with the Systemic Risk Center, London School of Economics, a Visiting Professor with the Center for Computational Finance and Economic Agents, University of Essex, and until recently a member of the Research Center for Blockchain Technologies, University College London. Her research interests include nature-inspired computational intelligence and heuristics for modeling complex sociotechnical systems, contagion mechanisms, and cognition.

Dr. Sergueva is an Associate Editor for IEEE TRANSACTIONS ON FUZZY SYSTEMS, has chaired the Computational Finance and Economics TC of IEEE Computational Intelligence Society in 2014–15, and is chairing 2018 Blockchain at IEEE WCCI.
