

Deformable Surface 3D Reconstruction from Monocular Images

Synthesis Lectures on Computer Vision

Editors

G rard Medioni, *University of Southern California*

Sven Dickinson, *University of Toronto*

Synthesis Lectures on Computer Vision publishes 50- to 150 page publications on topics pertaining to computer vision and pattern recognition. The scope largely follows the purview of premier computer science conferences, such as ICCV, CVPR, and ECCV.

SYNTHESIS LECTURES ON COMPUTER VISION #3

ABSTRACT

Being able to recover the shape of 3D deformable surfaces from a single video stream would make it possible to field reconstruction systems that run on widely available hardware without requiring specialized devices. However, because many different 3D shapes can have virtually the same projection, such monocular shape recovery is inherently ambiguous.

In this survey, we will review the two main classes of techniques that have proved most effective so far: The template-based methods that rely on establishing correspondences with a reference image in which the shape is already known, and non-rigid structure-from-motion techniques that exploit points tracked across the sequences to reconstruct a completely unknown shape. In both cases, we will formalize the approach, discuss its inherent ambiguities, and present the practical solutions that have been proposed to resolve them. To conclude, we will suggest directions for future research.

KEYWORDS

computer vision, deformable surfaces, monocular 3D shape recovery, structure from motion
