

Information and Influence Propagation in Social Networks

Synthesis Lectures on Data Management

Editor

M. Tamer Özsu, *University of Waterloo*

Synthesis Lectures on Data Management is edited by Tamer Özsu of the University of Waterloo. The series will publish 50- to 125 page publications on topics pertaining to data management. The scope will largely follow the purview of premier information and computer science conferences, such as ACM SIGMOD, VLDB, ICDE, PODS, ICDT, and ACM KDD. Potential topics include, but not are limited to: query languages, database system architectures, transaction management, data warehousing, XML and databases, data stream systems, wide scale data distribution, multimedia data management, data mining, and related subjects.

Information and Influence Propagation in Social Networks

Wei Chen, Laks V.S. Lakshmanan, and Carlos Castillo

2013

Data Cleaning: A Practical Perspective

Venkatesh Ganti and Anish Das Sarma

2013

Data Processing on FPGAs

Jens Teubner and Louis Woods

2013

Perspectives on Business Intelligence

Raymond T. Ng, Patricia C. Arocena, Denilson Barbosa, Giuseppe Carenini, Luiz Gomes, Jr.

SYNTHESIS LECTURES ON DATA MANAGEMENT #37

ABSTRACT

Research on social networks has exploded over the last decade. To a large extent, this has been fueled by the spectacular growth of social media and online social networking sites, which continue growing at a very fast pace, as well as by the increasing availability of very large social network datasets for purposes of research. A rich body of this research has been devoted to the analysis of the propagation of information, influence, innovations, infections, practices and customs through networks. Can we build models to explain the way these propagations occur? How can we validate our models against any available real datasets consisting of a social network and propagation traces that occurred in the past? These are just some questions studied by researchers in this area. Information propagation models find applications in viral marketing, outbreak detection, finding key blog posts to read in order to catch important stories, finding leaders or trendsetters, information feed ranking, etc. A number of algorithmic problems arising in these applications have been abstracted and studied extensively by researchers under the garb of *influence maximization*.

This book starts with a detailed description of well-established diffusion models, including the independent cascade model and the linear threshold model, that have been successful at explaining propagation phenomena. We describe their properties as well as numerous extensions to them, introducing aspects such as competition, budget, and time-criticality, among many others. We delve deep into the key problem of influence maximization, which selects key individuals to activate in order to influence a large fraction of a network. Influence maximization in classic diffusion models including both the independent cascade and the linear threshold models is computationally intractable, more precisely $\#P$ -hard, and we describe several approximation algorithms and scalable heuristics that have been proposed in the literature. Finally, we also deal with key issues that need to be tackled in order to turn this research into practice, such as learning the strength with which individuals in a network influence each other, as well as the practical aspects of this research including the availability of datasets and software tools for facilitating research. We conclude with a discussion of various research problems that remain open, both from a technical perspective and from the viewpoint of transferring the results of research into industry strength applications.

KEYWORDS

social networks, social influence, information and influence diffusion, stochastic diffusion models, influence maximization, learning of propagation models, viral marketing, competitive influence diffusion, game theory, computational complexity, approximation algorithms, heuristic algorithms, scalability.

To our families

Acknowledgments

The material presented here has been deeply influenced by the research we conducted with many wonderful colleagues, students, and post-doctoral fellows as well as the numerous stimulating discussions we have had with them. We would like to express our gratitude to our collaborators, including: Smriti Bhagat, Francesco Bonchi, Alex Collins, Rachel Cummings, Aristides Gionis, Amit Goyal, Xinran He, Dino Ienco, Qingye Jiang, Te Ke, Yanhua Li, Zhenming Liu, Wei Lu, Michael Mathioudakis, David Rincón, Guojie Song, Xiaorui Sun, Antti Ukkonen, Suresh Venkatasubramanian, Chi Wang, Yajun Wang, Wei Wei, Siyu Yang, Yifei Yuan, Li Zhang, and Zhi-Li Zhang. We are grateful to Lewis Tseng, Yajun Wang, and Cheng Yang for helpful discussions on some technical sections of the book, and to Tian Lin for running a few additional evaluation tests on top of what previously published papers had and for generating relevant plots. Thanks are due to Qiang Li, Tian Lin, Wei Lu, Lewis Tseng, Yajun Wang, and Cheng Yang for their careful reading of and excellent comments on the manuscript which greatly improved our presentation. We appreciate Diane Cerra and Tamer Ozsü for their assistance throughout the preparation of this manuscript and for their patience. Tamer's editorial comments were especially helpful in improving the readability. Last but not the least, we are indebted to our families whose patience and support throughout this project has been invaluable.
