

# Images in Social Media

*Categorization and Organization of Images and  
Their Collections*

# Synthesis Lectures on Information Concepts, Retrieval, and Services

## Editor

**Gary Marchionini**, *University of North Carolina at Chapel Hill*

Synthesis Lectures on Information Concepts, Retrieval, and Services publishes short books on topics pertaining to information science and applications of technology to information discovery, production, distribution, and management. Potential topics include: data models, indexing theory and algorithms, classification, information architecture, information economics, privacy and identity, scholarly communication, bibliometrics and webometrics, personal information management, human information behavior, digital libraries, archives and preservation, cultural informatics, information retrieval evaluation, data fusion, relevance feedback, recommendation systems, question answering, natural language processing for retrieval, text summarization, multimedia retrieval, multilingual retrieval, and exploratory search.

AND SERVICES #62*

## ABSTRACT

This book focuses on the methodologies, organization, and communication of digital image collection research that utilizes social media content. (“Image” is here understood as a cultural, conventional, and commercial—stock photo—representation.) The lecture offers expert views that provide different interpretations of images and their potential implementations. Linguistic and semiotic methodologies as well as eye-tracking research are employed to both analyze images and comprehend how humans consider them, including which salient features generally attract viewers’ attention.

This literature review covers image—specifically photographic—research since 2005, when major social media platforms emerged. A citation analysis includes an overview of co-citation maps that demonstrate the nexus of image research literature and the journals in which they appear. Eye tracking tests whether scholarly templates focus on the proper features of an image, such as people, objects, time, etc., and if a prescribed theme affects the eye movements of the observer. The results may point to renewed requirements for building image search engines. As it stands, image management already requires new algorithms and a new understanding that involves text recognition and very large database processing.

The aim of this book is to present different image research areas and demonstrate the challenges image research faces. The book’s scope is, by necessity, far from comprehensive, since the field of digital image research does not cover fake news, image manipulation, mobile photos, etc.; these issues are very complex and need a publication of their own. This book should primarily be useful for students in library and information science, psychology, and computer science.

## KEYWORDS

images, social media, image tags, academic image domains, image facets, image indexing, image guidelines, image retrieval, image literature review, PRISMA, Grounded Theory, eye-tracking, salient image features, test image templates, image citation analysis, image management, text recognition, image literacy

# Preface

Social media has focused much on pictures since its inception in 2005, and the amount of images on social media is overwhelming. It is impossible to be certain, but the number of images on social media can be counted in the billions. According to Search Engine Watch (2016), approximately 80 million images are uploaded every day to Instagram alone. What can be done with this titanic number of images? Do we strive for systems that can provide us with systematic access to all available images? Or, are we working toward systems where only a fraction of the available images is also retrievable?

Before the invention of social media, most research literature was concerned with classification schemes and their utilization for indexing and retrieving images as well as the improvement of these systems. Digitization of images began in the 1980s, and apart from storage problems that were resolved in the 1990s, the emphasis was on the amendment of taxonomies and on offering pictures in different sizes, where thumbnail recognition was frequently used because it provides a quick overview of many images. Query by Image Content (QBIC) is an approach that researches ways to extend and improve query methods for image databases. QBIC allows queries on large image and video databases based on example images, user-constructed sketches and drawings, selected color and texture patterns, camera and object motion, and other graphical information. However, none of these approaches have been successful solutions, although they have led the way for today's achievements.

After the launch of social media, experts realized that they could now test various indexing and retrieval methods in a new and cheap fashion using social networks, where they distinguish between controlled indexing based on classification techniques and uncontrolled indexing labeled tags. Several network providers use the successor to QBIC, known as Content-Based Image Retrieval (CBIR), where the contents are color, shape of a particular region in the picture, and texture features. However, these aspects only cover factual information. A picture can have different interpretations and meanings to different people even within the same domain, and the description and retrieval may depend on the user's situation and the research questions the scholar is facing. These interpretations, meanings, and descriptions need to be clarified before digitization.

In this book, we focus on what has been studied by academics and published in research papers concerning images in the digital age. We present a citation analysis to illustrate on which background the scholars build their research and if the history of image studies hamper new digital approaches. In the 1930s, groundbreaking research on eye movements and the connection between visual stimuli and cognitive processes was conducted. This research investigated users' areas of inter-

ests, i.e., measuring where the users' eyes dwell for a longer period of time on an image. Eye movement research still can offer a deeper understanding of our cognitive processes while also showing promising results in identifying the semantic structure of images by analyzing eye movements. Big data is available and data is important; however, data must be used with a strategy, and our smartest machines are still blind, so to take a picture is not the same as seeing a picture. We have to teach the computer to see like a human, which is more than factual CBIR. We want the computer to understand context and semantics from both the images and natural language synthesis, e.g., to dissect images into drops of similar colors and then use these drops as words of a visual vocabulary, i.e., automatic image indexing.

The target audience for this book is students in library information science, psychology, and computer science, but it is also relevant for people working in various fields and the interested non-professional who wishes to have up-to-date knowledge of photographic research.
